Introduction to Programming Screen Summary Report

The Programming Screen Summary Report shown below is a read-only version of information contained in the Programming Screen Summary Report generated by the ETDM Coordinator for the selected project after completion of the ETAT Programming Screen review. The purpose of the Programming Screen Summary Report is to summarize the results of the ETAT Programming Screen review of the project; provide details concerning agency comments about potential effects to natural, cultural, and community resources; and provide additional documentation of activities related to the Programming Phase for the project. Available information for a Programming Screen Summary Report includes:

- Screening Summary Report chart
- Project Description information (including a summary description of the project, a summary of public comments on the project, and community-desired features identified during public involvement activities)
- Purpose and Need information (including the Purpose and Need Statement and the results of agency reviews of the project Purpose and Need)
- Alternative-specific information, consisting of descriptions of each alternative and associated road segments; an overview of ETAT Programming Screen reviews for each alternative; and agency comments concerning potential effects and degree of effect, by issue, to natural, cultural, and community resources.
- Project Scope information, consisting of general project commitments resulting from the ETAT Programming Screen review, permits, and technical studies required (if any)
- Class of Action determined for the project
- Dispute Resolution Activity Log (if any)

The legend for the Degree of Effect chart is provided in an appendix to the report.

For complete documentation of the project record, also see the GIS Analysis Results Report published on the same date as the Programming Screen Summary Report.

Project Description Data

Description Statement

This project evaluates the need to extend SR 7 from SR 704 (Okeechobee Boulevard) to Northlake Boulevard in Palm Beach County. The project is located west of the Florida's Turnpike between the City of West Palm Beach, Village of Royal Palm Beach, and the Acreage community.

Four corridors and a no-build option have been identified for evaluation. Consideration of ongoing projects within the project study area includes Roebuck Road and the extension of Persimmon Boulevard, both under development by Palm Beach County. The Persimmon Boulevard Extension project will lengthen Persimmon Boulevard from its current termination point at 110th Avenue to the existing intersection of SR 7 and Okeechobee Boulevard. The design phase of this project has been completed. Roebuck Road, currently under design, will be a new facility that runs along the north side of the Baywinds community and connects the extension of Persimmon Boulevard with Jog Road.

The available Right-of-Way within the project area includes an approximate 200-foot-wide section owned by the FDOT that extends from the intersection of Okeechobee Boulevard and SR 7, continues beyond Northlake Boulevard, and terminates at SR 710. This section of Right-of-Way is adjacent to the City of West Palm Beach Water Catchment Area.

Corridor 1 (please note that this corridor is proposed to be discarded)

Beginning at the intersection of Okeechobee Boulevard and SR 7, Corridor 1 follows the County's extension of Persimmon Boulevard and continues north parallel to 110th Avenue. The proposed alignment then crosses over the M Canal and continues north just west of the Ibis Golf and Country Club before terminating at Northlake Boulevard.

Corridor 2 (please note that this corridor is proposed to be discarded)

Beginning at the intersection of Okeechobee Boulevard and SR 7, Corridor 2 proceeds north within the FDOT's existing Right-of-Way. Once adjacent to Section 1, the alignment turns to the northwest, continues through Section 1, and then turns north parallel to 110th Avenue. After crossing the M Canal, Corridor 2 continues along the west side of the Ibis Golf and Country Club before terminating at Northlake Boulevard.

Corridor 3

Beginning at the intersection of Okeechobee Boulevard and SR 7, Corridor 3 follows the County's extension of Persimmon Boulevard and continues north parallel to 110th Avenue. Near 60th Street, the alignment turns east, parallel to the M Canal, and then turns north while crossing the M Canal to tie into the FDOT's existing Right-of-Way. Once within the FDOT Right-of-Way, the alignment continues north along the east side of the Ibis Golf and Country Club before terminating at Northlake Boulevard.

Corridor 4

Beginning at the intersection of Okeechobee Boulevard and SR 7, Corridor 4 proceeds within the FDOT's existing Right-of-Way and crosses the M Canal before terminating at Northlake Boulevard. This alignment is commonly referred to as the "Range Line" alignment since the corridor runs directly over and parallel to the line separating Range 41 and 42.

Summary of Public Comments

Through initial outreach efforts, the community has expressed their support of the project with a preference for Corridor 4. In addition, the community has also expressed their lack of support for Corridor 1 due to impacts associated with potential residential relocations.

Community Desired Features

No desired features have been entered into the database. This does not necessarily imply that none have been identified.

Purpose and Need

Purpose and Need Statement

This project has been identified as a priority within the Palm Beach MPO's 2030 LRTP. The purpose of the project is to improve system linkage within the western fringes of urbanized Palm Beach County and provide additional capacity to ease the congestion experienced within the area defined by the Village of Royal Palm Beach, the Acreage community, and future developments. This project is needed because: (1) there is a clear necessity to improve system linkage between Okeechobee Boulevard and Northlake Boulevard; (2) the Palm Beach MPO has identified this project as a critical priority; and (3) travel demands within western Palm Beach County will continue to grow.

The proposed extension of SR 7 will facilitate the hurricane evacuation process by providing additional capacity and connectivity in this area. Okeechobee Boulevard is an east-west facility, classified as an Urban Principal Arterial, and provides a connection to the Florida's Turnpike Mainline and I-95. Northlake Boulevard is also an east-west facility, classified as an Urban Minor Arterial, and provides access to SR 710 and I-95. The limits established for this project, up to Northlake Boulevard, will allow for independent utility based on preliminary traffic modeling results and, therefore, the project is considered a reasonable expenditure without the need for future expansions or improvements. To accommodate the future traffic needs of Palm Beach County, the Palm Beach MPO has identified, in addition to the extension of SR 7, the need to widen Northlake Boulevard, up to six lanes, within the Cost Feasible Plan of the 2030 LRTP. Northlake Boulevard is currently a 4-lane divided facility around the project area.

1. System Linkage or Connectivity

As one of four major arterial facilities connecting Miami-Dade, Broward, and Palm Beach Counties, SR 7 is a critical inter-regional component of south Florida's transportation network. Other facilities, listed in order from west to east, include the Florida's Turnpike, I-95, and U.S. 1. Palm Beach County is currently experiencing a surge in residential development in the vicinity of the SR 7 project study area, and extending the corridor beyond Okeechobee Boulevard to Northlake Boulevard is vital to satisfying capacity and mobility needs.

Deficiencies in the transportation network were identified through a volume to capacity (v/c) ratio analysis. The v/c ratio is the relationship between the volume of vehicles per day traveling on the roadway and the total daily capacity that the roadway can carry. A value equal to 1.0 signifies that the volume of traffic is equal to the capacity of that roadway. A value below 1.0 corresponds to a roadway operating below capacity, and conversely, a value above 1.0 signifies that the volume exceeds capacity. For commuters traveling north or south between Okeechobee Boulevard and Northlake Boulevard west of the project study area, the primary route utilized includes Royal Palm Beach Boulevard, Orange Boulevard, and Coconut Boulevard. The v/c ratio for these facilities currently exceeds 1.0.

2. Transportation Demand

The proposed extension of SR 7 is consistent with the following transportation plans:

- Palm Beach County Comprehensive Plan (Transportation Element, Policy 1.4-m)
- Palm Beach MPO Year 2030 Long Range Transportation Plan (LRTP), Cost Feasible Plan

3. Federal, State, or Local Government Mandate

On June 17, 2004, the Palm Beach MPO filed a motion to direct FDOT to begin a PD&E study for extending SR 7 beyond Okeechobee Boulevard. The motion was carried unanimously. Traffic demand associated with future developments within the area indicated a need for extending SR 7 to relieve congestion within the western portions of the County. The limits of the project, from Okeechobee Boulevard to Northlake Boulevard, were established during the next meeting on July 15, 2004.

The project was added to the Tentative Fiscal Year (FY) 2006-10 Transportation System Priorities list and

presented to the MPO Board on October 21, 2004 for approval. The project list was then transmitted to the FDOT, District Four, for inclusion in its Work Program.

4. Social Demands or Economic Development

Current and future development growth in Palm Beach County is primarily located west of the project study area. Three large-scale communities are planned within a 7 mile radius of the project. Those include Callery-Judge Groves, Exploration Pointe (located on the Vavrus Ranch property), Indian Trail Groves, and the Palm Beach County Biotechnology Research Park.

A Development of Regional Impact (DRI) application has been submitted for the Callery-Judge Groves, Exploration Pointe, and the Indian Trail Groves community with all proposals currently under review. The DRI application for the Palm Beach County Biotechnology Research Park, located on the former Mecca Farms property, has been approved for 2,000 residential units in addition to retail and industrial spaces.

Development of the Biotechnology Research Park was initiated by the need to provide office, laboratory, and educational facilities for the Scripps Research Institute (Scripps). Palm Beach County took the lead role in developing the 1,919 acre Mecca Farms property to accommodate elements necessary for maximizing the potential economic benefits associated with Scripps. However, on February 14, 2006, the Palm Beach County Board of County Commissioners voted in favor of relocating Scripps to the Florida Atlantic University campus in Jupiter, Florida, approximately 9 miles from the project study area, to avoid further project delays.

The future of the Biotechnology Research Park remains unclear and a new concept (unrelated to Scripps) may be presented that will further increase the demands of the region. The project study team will continue to track current and future development activity within the region.

The combination of the proposed and approved DRI applications will result in approximately 34,307 residential units along with retail, industrial, and commercial spaces.

5. Modal Interrelationships

Existing bus services provided by Palm Tran near the project area is limited to Route 52, the Royal Palm Beach Crosstown route. This route loops between Okeechobee Boulevard, SR 7, Southern Boulevard, and Royal Palm Beach Boulevard. Following the corridor selection phase, the project team will coordinate with Palm Tran for future bus service needs along the proposed extension. Other features such as pedestrian sidewalks and bike lanes will be provided per FDOT policies.

Comments

I understand the need to extend SR 7 to aid in the increased north-south traffic flow in this area, especially with the proposed new DRI developments. However, the alternatives analysis for each proposal will be extremely important in the Corps' review. We will need to see each alternative proposed, the pros and cons of each alternative, considering the public interest review.

Federal Highway Administration Comments

Agency	Acknowledgment	Review Date
Federal Highway Administration	Accepted	4/26/2007

Comments

A succinct, clearly stated purpose and need statement that speaks directly to the major issues surrounding the need for the project should be provided. The text following the statement can then serve to substantiate the purpose and need and expand on the reasons given for the project being warranted. The project description section makes note that corridors 1 and 2 are proposed to be discarded. Information needs to be included here as to why these two corridors may be dropped from further consideration.

The Executive Summary Section of the Purpose and Need consolidates much of the analysis in this section for the development of a Purpose and Need Statement that can be used in the environmental document. The Purpose and Need Statement should be developed based on input from the public and participating agencies. For the Purpose and Need Statement, SAFETEA-LU requires a clear statement of identified objectives that the proposed project is intended to achieve for improving transportation conditions. The objectives should be derived from needs and may include, but are not limited to, the following outlined in SAFETEA-LU:

Achieving a transportation objective identified in the statewide or metropolitan transportation plan;

Supporting land use, economic development, or growth objectives established in applicable Federal State, local or tribal plans;

Serving national defense, national security, or other national objectives, as established in Federal laws, plans or policies.

From the information provided, it appears that the Purpose and Need Statement should be developed to specifically target identified objectives regarding regional connectivity, land use, congestion relief to nearby roadways, and possibly economic development.

SAFETEA-LU requires an opportunity for involvement by participating agencies and the public in defining the range of alternatives. This opportunity must be provided prior to the lead Federal agency's decision regarding the range of reasonable alternatives to be evaluated. That this project is proceeding using the ETDM planning and programming screens will assist meeting the SAFETEA-LU provisions. The project sponsor should also encourage input regarding how many lanes are needed for each alternative.

Estimated project cost and funding source is not identified. The Project Description Report indicates that the project was added to the LRTP, so presumably this information is available in the LRTP, and should be included in the Project Description Report. This information will be important in the project prioritization process to weigh the merits of this project against others competing for limited funding.

The project as shown in ETDM ends at North Lake Boulevard. Additional discussions should occur between FDOT and FHWA regarding the selection and justification of these termini for the long range improvement to ensure that it adequately addresses the Purpose and Need statement that is being developed for the environmental document. The reasons for selecting the termini should be discussed to ensure there is

justification.

3 Summary Degree of Effect

Floodplains Summary Degree of Effect: Moderate

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The EST GIS Analysis shows the following acreage of FEMA FIRM floodzones within the project's 500-foot buffer. (A 500-foot buffer was used due to the proposed new 6-lane divided alignment):

Zone X500 (532 acres): an area inundated by 100-year flooding with average depths of less than 1 foot or with drainage areas less than one square mile.

Based on these results, 100 percent of the 500-foot buffer for this alternative occurs within a designated floodzone. A Location Hydraulics Report will be prepared for the project and the project will be designed to minimize floodplain impacts and compensate for potential floodplain encroachments. For these reasons the summary degree of effect assigned to Floodplains is moderate.

Identified Resources and Level of Importance:

Public Conservation Lands

Comments on Effects to Resources:

Service Comments, Fish and Wildlife Resources, Wetlands, and Special Designations:

Corridor 1 would follow Palm Beach County's Persimmon Boulevard Extension corridor and proceed straight northward from the M-Canal approximately 3 miles to North Lake Avenue. The Service notes that Corridor 1 would impact wetlands and uplands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the proposed Persimmon Boulevard Extension and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beach's Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands and uplands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a

management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

The Service was involved in the review of the Palm Beach County's Persimmon Boulevard Extension project (also known as the Acreage Reliever Road). We worked with the County, and the U.S. Army Corps of Engineers (Corps) to develop an alignment that would minimize fragmentation of fish and wildlife habitat by locating the corridor as far to the west as possible. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). Our planning effort resulted in the adoption by Palm Beach County of the Persimmon Boulevard Extension corridor as illustrated in Figures 1-4 provided in the Project Description. It was our understanding that the extension of State Road 7 to Northlake Boulevard would consist of extending the Persimmon Boulevard corridor as illustrated in Alternatives 1 or 3. Accordingly, we were surprised to now see Corridors 2 and 4 proposed as alternatives for the project. Based on information from Palm Beach County's consultant, it was the Service's understanding that the portion of the FDOT right-of-way that is adjacent to the Section 1 mitigation parcel was included as mitigation for the Persimmon Boulevard Extension Project. The inclusion of this portion of the right-of-way was the basis for the Service's concurrence letter to the Corps on the Persimmon Boulevard Extension project (see Attachments 1 and 2 in Additional Comments Section). Without the inclusion of the FDOT right-of-way as part of the mitigation plan, the Service would have not provided a concurrence letter to the Corps at that time.

The Service notes that the construction of a new roadway to extend State Road 7 in the project area could result in a variety of adverse impacts to fish and wildlife including: the direct loss of habitat, mortality due to collisions with vehicles, increased disturbance and a reduction in habitat quality adjacent to the roadway, and the fragmentation of existing habitat. The Service believes that Corridor 1 would result in the least impacts to fish and wildlife habitat, wetlands, and conservation lands of the four corridors proposed. The Project Description indicates that Corridor 1 is proposed to be discarded. We strongly urge that Corridor 1 be maintained as an alternative and adopted as the preferred alternative for the project.

To reduce the potential for wildlife mortality resulting from collisions with motor vehicles, the Service requests that the roadway corridor be fenced along its eastern boundary to prevent wildlife from entering the roadway. The fence should consist of a 10-foot tall chain-link with a 2-foot-wide section of angled barbed wire at the top. The base of the fence should include a barrier constructed of hardware cloth (or other suitable material) of sufficiently small mesh size and height to prevent small animals (frogs, snakes etc.) from passing through the fence and entering the roadway. In lieu of a fence, a 10-foot tall barrier wall could be constructed along the eastern boundary of the road right-of-way. The construction of a barrier wall is preferable to a fence because it would reduce road noise and disturbance to wildlife. The construction of a barrier wall is also preferable to the construction of a dike because the barrier wall would reduce the size of the project footprint and inturn impacts to valuable natural resources.

Palm Beach Gardens, Florida 3341 0

Attention: Brandon Howard

Service Log No.: 4-1-05-1 -9856

Corps Application No.: SAJ-2002-8273 (IP-KBH)

Date Received: August 14,2005

Project : Acreage Reliever Road

Applicant: Palm Beach County

County:Palm Beach County

Dear Mrs. Evans:

The Fish and Wildlife Service (Service) has reviewed your Public Notice and other information submitted by the U.S. Army Corps of Engineers (Corps) for the application referenced above. This letter is submitted in accordance with section 7 of the Endangered Species Act of 1973, as amended (87 Stat. 884; 16 U.S.C. 1531 et seq.) and the provisions of the Fish and Wildlife Coordination Act of 1958, as amended (48 Stat. 401 ; 16 U.S.C. 661 et seq.).

PROJECT DESCRIPTION

The applicant proposes to construct a new four-lane roadway, known as the "Acreage Reliever Road," from Okeechobee Boulevard to 60th Street. The purpose of the project is to improve traffic flow in the area. The project will impact a total of 106 acres of wetlands. Wetlands at the project site consist of hydric pine (*Pinus elliottii*) flatwoods, wet prairie, and cypress (*Taxodium distichum*) wetlands. Some of the wetlands in the project site have been impacted by melaleuca (*Melaleuca quinquenervia*). As compensation for impacts to wetlands, the applicant had proposed to preserve and enhance 624.6 acres of high-quality wetlands and uplands within Sections 1, 12, 13, and 24, Township 43 South, Range 41 East, and to preserve and enhance 33.3 acres of uplands and wetlands west of the project corridor from 40th Street to 60th Street. Enhancement activities will consist of removal of exotic vegetation. The entire mitigation area will be added to Palm Beach County's Pond Cypress Natural Area. The project is located in Sections 1, 12, 13, 14, and 24, Township 43 South, Range 41 East, Palm Beach County, Florida. Lawrence C. Evans

THREATENED AND ENDANGERED SPECIES

Page 2

Wood stork

The project site is located within the core foraging areas (CFA) (i.e., within 18.6 miles) of four active breeding colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA may reduce foraging opportunities for wood storks. To minimize adverse effects to the wood stork, the Service's Draft Supplemental Habitat Management Guidelines for the Wood Stork in the South Florida Ecological Services Consultation Area (Service 2002) (Guidelines) recommends that the applicant replace wetlands lost due to the action. The compensation plan should include a temporal lag factor, if necessary, to ensure that wetlands provided as compensation adequately replace the wetland functions lost due to the project. Moreover, wetlands offered as compensation should be of the same hydroperiod, and located within the CFA of the affected wood stork colony. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a "Service Approved" mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Corps has determined the project "may affect, but is not likely to adversely affect" the wood stork. In our letter to the Corps, dated December 10, 2005, the Service noted information provided to the Service by the applicant's consultant indicated the wetlands mitigation proposed for the project had been reduced from 624.6 to 544.0 acres. A total of 80.6 acres of land (currently owned by the Florida Department of Transportation) located along the east side of the mitigation parcel had been removed from the mitigation proposal. The Service stated: (1) the compensation was not adequate to offset the loss of foraging habitat to the wood stork, (2) we could not provide concurrence for the Corps' determination, and (3) we recommended the applicant provide an additional 80.6 acres of mitigation in order to fulfill the original mitigation proposal. Based on recent discussions with the applicant's consultant and the Corps, we now understand this information was incorrect and the parcel is still included in the mitigation proposal. The Corps will require the applicant to preserve the 80.6-acre parcel within 1 year of issuance of the permit, and this will be included as a condition of the permit. Based on this new

information, the Service believes the wetlands mitigation proposal is now adequate to compensate for the loss of wood stork foraging habitat, and we concur with the Corps' determination for the wood stork.

FISH AND WILDLIFE RESOURCES

The project will result in impacts to 106 acres of wetlands. The applicant proposes to mitigate the loss of wetlands by preserving and enhancing 624.6 acres of high-quality wetlands and uplands near the project site. The Service believes the proposed mitigation is adequate to compensate for the loss of wetlands resulting from the project.

Summary Degree of Effect

Water Quality and Quantity Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Because of the concerns stated by FDEP, notably the presence of the City of West Palm Beach Water Catchment Area immediately adjacent to the project, the summary degree of effect assigned to Water Quality and Quantity is substantial.

ETAT Reviews for Water Quality and Quantity**4** ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Water Quality and Quantity Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Stormwater runoff from the road surface may alter adjacent wetlands and surface waters through increased pollutant loading. Natural resource impacts within and adjacent to the proposed road right-of-way will likely include alteration of the existing surface water hydrology and natural drainage patterns, and reduction in flood attenuation capacity of area creeks, ditches, and sloughs as a result of increased impervious surface within the watershed. Every effort should be made to maximize the treatment of stormwater runoff from the proposed road project to prevent ground and surface water contamination. Stormwater treatment should be designed to maintain the natural pre-development hydroperiod and water quality, as well as to protect the natural functions of adjacent wetlands.

Comments on Effects to Resources:

We recommend that the study include an evaluation of existing stormwater treatment adequacy and details on the future stormwater treatment facilities. Retro-fitting of stormwater conveyance systems would help reduce impacts to water quality. Increased stormwater runoff carrying oils, greases, metals, sediment, and other pollutants from the increased impervious surface would be of significant concern.

Additional Comments (optional):

The Water Catchment Area for the City of West Palm Beach is immediately adjacent to the project. All activities must be designed to prevent stormwater pollutant contamination of the City's water supply. DEP recommends that the FDOT work to include the City on all decisions affecting this critical area.

4 Summary Degree of Effect

Wetlands Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The acreage of wetlands and open water habitats reported by the ETDM GIS Analysis within the 500-foot buffer for this alternative is as follows:

National Wetlands Inventory database - 135.1 acres; Wetlands 2000 database - 76.2 acres; 2003 FFWCC Habitat and Landcover Grid database - 117.3 acres.

The proposed project is a 6-lane divided highway that would occupy much of the 500-foot buffer. Because of the large area of wetlands occurring within the 500-foot buffer, the summary degree of effect assigned to Wetlands is substantial.

ETAT Reviews for Wetlands

4 ETAT Review by Alisa Zarbo, US Army Corps of Engineers (08/22/2006)

Wetlands Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Wetlands: This area was evaluated and considered in the permitting of the Acreage Reliever Road and has an extremely high level of importance to the Corps. Wildlife corridors were incorporated into the alignment of the Acreage Reliever Road. The Corps would try to keep the same continuity of the corridors when permitting this extension.

Comments on Effects to Resources:

If the roadway was constructed through corridor 4, it would fragment an extremely sensitive greenway and wildlife corridor that exists between the PCNA, the WCA and Section 1. The alignment would isolate the PCNA and the WCA to the extent that reptiles, amphibians and small and large mammals could not easily access the adjacent natural areas. Large natural areas are necessary for certain wildlife to carry out life functions such as feeding and nesting. Smaller isolated areas may accommodate only a few individuals with modest home range requirements. Small mammals and other forest dwelling wildlife have shown an aversion to using areas with less vegetative cover. This would be the case with a four-lane roadway that has a shoulder and median. Although some animals have an aversion to roadways, many attempt to cross and result in collisions that impact both wildlife and humans. During 1990, 431 vehicle collisions with animals (wild and domestic) were serious enough to be reported to the Florida Department of Highway Safety and Motor Vehicles. These accidents resulted in 4 human fatalities and 380 injuries. The average estimated property damage for each accident was \$3,395. Corridor 4 could result in extensions, as shown in the Conceptual Analysis Matrix, to access the Acreage. These extensions further fragment the ecosystem and isolate Section 1. Placing the roadway down the Rangeline would put it adjacent to the WCA. The WCA is a Class I potable water supply for the City of West Palm Beach. The roadway run-off would pose serious threats to the City's drinking water supply. The alternative of using a bridge along the Rangeline would not be a feasible alternative due to it being adjacent to the WCA.

Up to 60th Street, Corridor 3 has been approved by the Corps. From 60th Street the roadway is shown going east along the M-Canal. This portion and the following north south portion of the roadway that ends at Northlake Boulevard would isolate the mitigation area for the Ibis Golf and Country Club. Requirements

for the portion of the roadway adjacent to the mitigation area would include fencing on both sides of the roadway, culverts to maintain adequate hydrology, slower speed limits, wildlife crossing signs and culverts for wildlife crossings or bridges. The wildlife crossings should be placed above the seasonal high water elevation of wetlands but adjacent to wetlands. Wildlife crossings should be placed just above the ecotone of the wetland. The median should also be devoid of vegetation that would give the illusion of a narrow roadway to wildlife. Wildlife is more adverse to crossing wider roadways. Median landscaping plants should not provide a food source for wildlife. This would entice wildlife to cross the roadway and go into the median for food resulting in road kill. This area is within the Loxahatchee River Watershed and to a limited extent the Lake Worth Lagoon.

Additional Comments (optional):

Mitigation efforts should be concentrated in the same watershed. Mitigation options could include widening of the M-Canal and planting a flow through marsh to improve water quality. Mitigation in the WCA may also be appropriate for this project.

Additional Comments (optional):

Based on the project location and information provided on the ETDM website, NOAA's National Marine Fisheries Service (NOAA Fisheries) concludes the proposed work would not directly impact areas that support NOAA trust resources. We have no comments or recommendations to provide pursuant to the essential fish habitat (EFH) requirements of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) P.L. 104-297. Further consultation on this matter is not necessary unless future modifications are proposed and you believe that the proposed action may result in adverse impacts to EFH.

Coordinator Feedback:None

4

ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Wetlands Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

The National Wetlands Inventory GIS report indicates that there are 135.13 acres of palustrine and 1.67 acres of riverine wetlands within the 500-ft. project buffer zone. The Wetlands 2000 Inventory indicates that there are 3.87, 19.91, 929.43, 144.87, 173.97, 712.39 and 18.29 acres of cypress, emergent aquatic vegetation, freshwater marsh, mixed shrubs, mixed wetland hardwoods, wet pinelands and wet prairies wetlands, respectively, within the 5,280-ft. buffer of the project area.

Comments on Effects to Resources:

The project will require an environmental resource permit (ERP) from the South Florida Water Management District. The ERP applicant will be required to eliminate or reduce the proposed wetland resource impacts of the roadway extension project to the greatest extent practicable:

- Minimization should emphasize avoidance-oriented corridor alignments, wetland fill reductions via pile bridging and median width reductions within safety limits.
- Wetlands should not be displaced by the installation of stormwater conveyance and treatment swales; compensatory treatment in adjacent uplands is the preferred alternative. All stormwater treatment should be located in upland sites.
- After avoidance and minimization have been exhausted, mitigation must be proposed to offset the adverse impacts of the project to existing wetland functions and values. Significant attention is given to forested wetland systems, which are difficult to mitigate.
- The cumulative impacts of concurrent and future road improvement projects in the vicinity of the subject project should also be addressed.

Additional Comments (optional):

DEP ranks the Corridor 1 Alternative as # 1. The Department strongly recommends bridging ALL wetland crossings to minimize impacts to wetland connectivity and hydroperiod. Additionally, all stormwater should be conveyed to treatment sites located in upland areas.

Comments on Effects to Resources:

Service Comments, Fish and Wildlife Resources, Wetlands, and Special Designations:

Corridor 1 would follow Palm Beach County's Persimmon Boulevard Extension corridor and proceed straight northward from the M-Canal approximately 3 miles to North Lake Avenue. The Service notes that Corridor 1 would impact wetlands and uplands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the proposed Persimmon

Boulevard Extension and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beach's Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands and uplands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

The Service was involved in the review of the Palm Beach Countys Persimmon Boulevard Extension project (also known as the Acreage Reliever Road). We worked with the County, and the U.S. Army Corps of Engineers (Corps) to develop an alignment that would minimize fragmentation of fish and wildlife habitat by locating the corridor as far to the west as possible. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). Our planning effort resulted in the adoption by Palm Beach County of the Persimmon Boulevard Extension corridor as illustrated in Figures 1-4 provided in the Project Description. It was our understanding that the extension of State Road 7 to Northlake Boulevard would consist of extending the Persimmon Boulevard corridor as illustrated in Alternatives 1 or 3. Accordingly, we were surprised to now see Coridors 2 and 4 proposed as alternatives for the project. Based on information from Palm Beach County's consultant, it was the Service's understanding that the portion of the FDOT right-of-way that is adjacent to the Section 1 mitigation parcel was included as mitigation for the Persimmon Boulevard Extension Project. The inclusion of this portion of the right-of-way was the basis for the Service's concurrence letter to the Corps on the Persimmon Boulevard Extension project (see Attachments 1 and 2 in Additional Comments section). Without the inclusion of the FDOT right-of-way as part of the mitigation plan, the Service would have not provided a concurrence letter to the Corps at that time.

The Service notes that that the construction of a new roadway to extend State Road 7 in the project area could result in a variety of adverse impacts to fish and wildlife including: the direct loss of habitat, mortality due to collisions with vehicles, increased disturbance and a reduction in habitat quality adjacent to the roadway, and the fragmentation of existing habitat. The Service believes that Corridor 1 would result in the least impacts to fish and wildlife habitat, wetlands, and conservation lands of the four corridors proposed. The Project Description indicates that Corridor 1 is proposed to be discarded. We strongly urge that Corridor 1 be maintained as an alternative and adopted as the preferred alternative for the project.

To reduce the potential for wildlife mortality resulting from collisions with motor vehicles, the Service requests that the roadway corridor be fenced along its eastern boundary to prevent wildlife from entering the roadway. The fence should consist of a 10-foot tall chain-link with a 2-foot-wide section of angled barbed wire at the top. The base of the fence should include a barrier constructed of hardware cloth (or other suitable material) of sufficiently small mesh size and height to prevent small animals (frogs, snakes etc.) from passing through the fence and entering the roadway. In lieu of a fence, a 10-foot tall barrier wall could be constructed along the eastern boundary of the road right-of-way. The construction of a barrier wall is preferable to a fence because it would reduce road noise and disturbance to wildlife. The construction of a barrier wall is also preferable to the construction of a dike because the barrier wall would reduce the size of the project footprint and inturn impacts to valuable natural resources.

Dear Mrs. Evans:

The Fish and Wildlife Service (Service) has reviewed your Public Notice and other information submitted by the U.S. Army Corps of Engineers (Corps) for the application referenced above. This letter is submitted in accordance with section 7 of the Endangered Species Act of 1973, as amended (87 Stat. 884; 16 U.S.C. 1531 et seq.) and the provisions of the Fish and Wildlife Coordination Act of 1958, as amended (48 Stat. 401 ; 16 U.S.C. 661 et seq.).

PROJECT DESCRIPTION

The applicant proposes to construct a new four-lane roadway, known as the "Acreage Reliever Road," from Okeechobee Boulevard to 60th Street. The purpose of the project is to improve traffic flow in the area. The project will impact a total of 106 acres of wetlands. Wetlands at the project site consist of hydric pine (*Pinus elliottii*) flatwoods, wet prairie, and cypress (*Taxodium distichum*) wetlands. Some of the wetlands in the project site have been impacted by melaleuca (*Melaleuca quinquenervia*). As compensation for impacts to wetlands, the applicant had proposed to preserve and enhance 624.6 acres of high-quality wetlands and uplands within Sections 1, 12, 13, and 24, Township 43 South, Range 41 East, and to preserve and enhance 33.3 acres of uplands and wetlands west of the project corridor from 40th Street to 60th Street. Enhancement activities will consist of removal of exotic vegetation. The entire mitigation area will be added to Palm Beach County's Pond Cypress Natural Area. The project is located in Sections 1, 12, 13, 14, and 24, Township 43 South, Range 41 East, Palm Beach County, Florida.
Lawrence C. Evans

THREATENED AND ENDANGERED SPECIES

Page 2

Wood stork

The project site is located within the core foraging areas (CFA) (i.e., within 18.6 miles) of four active breeding colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA may reduce foraging opportunities for wood storks. To minimize adverse effects to the wood stork, the Service's Draft Supplemental Habitat Management Guidelines for the Wood Stork in the South Florida Ecological Services Consultation Area (Service 2002) (Guidelines) recommends that the applicant replace wetlands lost due to the action. The compensation plan should include a temporal lag factor, if necessary, to ensure that wetlands provided as compensation adequately replace the wetland functions lost due to the project. Moreover, wetlands offered as compensation should be of the same hydroperiod, and located within the CFA of the affected wood stork colony. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a "Service Approved" mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Corps has determined the project "may affect, but is not likely to adversely affect" the wood stork. In our letter to the Corps, dated December 10, 2005, the Service noted information provided to the Service by the applicant's consultant indicated the wetlands mitigation proposed

for the project had been reduced from 624.6 to 544.0 acres. A total of 80.6 acres of land (currently owned by the Florida Department of Transportation) located along the east side of the mitigation parcel had been removed from the mitigation proposal. The Service stated: (1) the compensation was not adequate to offset the loss of foraging habitat to the wood stork, (2) we could not provide concurrence for the Corps' determination, and (3) we recommended the applicant provide an additional 80.6 acres of mitigation in order to fulfill the original mitigation proposal. Based on recent discussions with the applicant's consultant and the Corps, we now understand this information was incorrect and the parcel is still included in the mitigation proposal. The Corps will require the applicant to preserve the 80.6-acre parcel within 1 year of issuance of the permit, and this will be included as a condition of the permit. Based on this new information, the Service believes the wetlands mitigation proposal is now adequate to compensate for the loss of wood stork foraging habitat, and we concur with the Corps' determination for the wood stork.

FISH AND WILDLIFE RESOURCES

The project will result in impacts to 106 acres of wetlands. The applicant proposes to mitigate the loss of wetlands by preserving and enhancing 624.6 acres of high-quality wetlands and uplands near the project site. The Service believes the proposed mitigation is adequate to compensate for the loss of wetlands resulting from the project.

Lawrence C. Evans Page 3

Thank you for allowing us to provide these comments and for your cooperation and effort in protecting federally listed species. If you have any questions regarding this project, please contact John Wrublik at 772-562-3909, extension 282.

Coordinator Summary

4 Summary Degree of Effect

Wildlife and Habitat Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Both the FFWCC and USFWS indicated that several state and federally listed species may occur within the project area. Although no listed species occurrences are reported within the 500-foot buffer for this alternative, there is a high likelihood of occurrence of listed wading birds and wood storks because of the large area of wetlands present along this alignment. This alternative is also adjacent to publicly owned conservation lands. In addition, the 500-foot buffer for this alternative contains pineland that requires prescribed burning for habitat management. For these reasons, the summary degree of effect assigned to Wildlife and Habitat is substantial.

ETAT Reviews for Wildlife and Habitat

3 ETAT Review by Scott Sanders, FL Fish and Wildlife Conservation Commission (08/04/2006)

Wildlife and Habitat Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The Habitat Conservation Scientific Services Section of the Florida Fish and Wildlife Conservation Commission (FWC) has coordinated an agency review of ETDM #8127 in Palm Beach County, and provides the following comments related to potential impacts to fish and wildlife resources for this Programming Phase project.

The proposed project involves an evaluation of need to extend SR 7 from SR 704 (Okeechobee Boulevard) to Northlake Boulevard in Palm Beach County. Four corridors and a No-Build option have been identified for the project.

The Corridor 1 alternative would begin at the intersection of Okeechobee Boulevard and SR 7, follow the County's extension of Persimmon Boulevard, and continue north parallel to 110th Avenue. The alignment crosses over the M Canal and continues north adjacent to the Ibis Golf and Country Club, and terminates at Northlake Boulevard.

This project was reviewed under the Advanced Notification process through the Florida State Clearinghouse at the Florida Department of Environmental Protection under SAI FL200506231187C (letter dated August 10, 2005, attached), and SAI# 9811160726C (letter dated December 2, 1998 attached). These FWC letters provide a detailed overview of project resources, including listed wildlife and plant species, potential impacts, and a course of action to reduce these impacts. We have reviewed these letters, and our previous comments remain applicable to the currently proposed project.

A GIS analysis of fish and wildlife and habitat resources was conducted using the Environmental Screening Tool (EST), and those results indicate that very similar upland and wetland habitat types are present along all four corridors. Uplands within 500 feet of the proposed Corridor 1 include mixed pine-hardwood forest, pinelands, upland hardwood hammock, and dry prairie. Wetlands along this corridor include cypress swamp, cypress/pine/cabbage palm, freshwater marsh and wet prairie, hardwood swamp, mixed wetlands forests, open water, sawgrass marsh, and shrub swamp. Approximately 58.1 percent of

the land within 500 feet of the road is in high and low impact urban land uses. An overall accounting of the species listed by FWC which may occur in and adjacent to the project area include the eastern indigo snake (Threatened [T]), Florida pine snake (Species of Special Concern [SSC]), gopher tortoise (SSC), Shermans fox squirrel (SSC), Florida mouse (SSC), little blue heron (SSC), tricolored heron (SSC), white ibis (SSC), wood stork (E), snail kite (E), bald eagle (T), crested caracara (T), southeastern kestrel (T), limpkin (SSC), Florida sandhill crane (T), Florida burrowing owl (SSC), and red-cockaded woodpecker (SSC). The presence or absence of some of these species within the project area is highly dependent on habitat type, plant successional stage, habitat quality, and site drainage conditions.

Habitat quality within 500 feet of the Right-of-way (ROW) for Corridor 1 was evaluated using five natural resource data layers in the EST. FWCs Biodiversity Hotspots data layer shows that 20 percent of the area is capable of supporting three to four focal species. Based on FWCs Integrated Wildlife and Habitat Ranking System map, a total of 21 percent of this zone along the corridor has been assigned a score of from 6 to 8 (Scale 1 = Low, 10 = High), which ranks as good to excellent quality. According to FWCs Priority Wetlands Map for wetlands dependent listed species, 20.6 percent of the habitat along the proposed roadway zone is ranked as capable of supporting 1 to 3 species in uplands, and 4 to 6 species in wetlands. Within this zone, public and managed lands include the Pond Cypress Natural Area. FWC has also designated Strategic Habitat Conservation Areas for the limpkin and wading birds within approximately 30 percent of the corridor zone. The zone within 500 feet of Corridor 1, contains by far, the lowest acreage percentage for lands evaluated within the five data layers above, therefore less high quality habitat and public lands would be at risk from direct and secondary impacts.

Comments on Effects to Resources:

Direct impacts of the project could be minimal to moderate depending on avoidance and minimization measures implemented, and include habitat loss from roadway and Drainage Retention Area (DRAs) construction, which could adversely affect a number of listed wildlife species. Due to the close proximity of one public land tract, this corridor will potentially have a moderate direct impact on public lands.

Additional Comments (optional):

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we would recommend the selection of Corridor 1, which would have significantly lower impacts on natural resources.

We recommend the following measures be considered during the Project Development and Environment (PD&E) Study to avoid, minimize, and mitigate project impacts to listed species and habitat:

1. A vegetative cover map and accounting by acreage for each plant community type should be made for the affected project area. Compensatory mitigation for all upland and wetlands habitat loss should be required. If wetlands are mitigated under the provisions of Chapter 373.4137 F.S., the proposed mitigation sites should be located within the immediate or same regional area, functionally equivalent, equal to or of higher functional value, and as or more productive as the wetlands impacted by the project.
2. Surveys for listed species should be performed within and adjacent to the ROW and proposed sites for DRAs during the PD&E Study. The methodology for these surveys should be coordinated with FWC, and follow appropriate survey techniques or guidelines to determine presence, absence or probability of occurrence of various species, and to assess habitat quality. These study methods should be designed considering the potential listed species discussed above.
3. Based on the survey results, a plan should also be developed to address direct, secondary, and cumulative impacts of the project on wildlife and habitat resources, including listed species. Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate

and supported by our agency.

4. The PD&E Study should also include an investigation of the design, cost, location, and construction techniques for longer bridges over streams or sloughs, canals and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.

5. Habitat impacts in both uplands and wetlands may be avoided where possible by interchangeably designing the road expansion through those areas where less habitat resources occur. In addition, using the median and roadside swales for treating roadside runoff would reduce the need for some off-site DRAs, and assist in reducing habitat loss.

6. Construction equipment staging areas; storage of oils, greases, and fuel; fill and roadbed material; and vehicle maintenance activities should be sited in previously disturbed areas far removed from streams, wetlands, or surface water bodies. Staging areas, along with borrow areas, should also be surveyed for listed species.

We appreciate the opportunity to provide input on highway design and the conservation of fish and wildlife resources. Please contact Steve Lau in our Vero Beach Office at (772) 778-5094 for further coordination on this project.

4 ETAT Review by John Wrublik, US Fish and Wildlife Service (07/18/2006)

Wildlife and Habitat Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

Federally Listed Species and Fish and Wildlife Resources

Comments on Effects to Resources:

Service Comments, Federally Listed Species: The Service has reviewed our Geographic Information Systems (GIS) database for recorded locations of federally listed threatened and endangered species on or adjacent to the project study area. The GIS database is a compilation of data received from several sources.

Wood Stork

The project corridor is located in the Core Foraging Areas (within 18.6 miles) of three active nesting colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA due to an action could result in the loss of foraging habitat for the wood stork. To minimize adverse effects to the wood stork, we recommend that any lost foraging habitat resulting from the project be replaced within the CFA of the affected nesting colony. Moreover, wetlands provided as mitigation should adequately replace the wetland functions lost as a result of the action. The Service does

not consider the preservation of wetlands, by itself, as adequate compensation for impacts to wood stork foraging habitat, because the habitat lost is not replaced. Accordingly, any wetland mitigation plan proposed should include a restoration, enhancement, or creation component. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a Service Approved mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Service believes that the following federally listed species have the potential to occur in or near the project site: wood stork, Everglade snail kite (*Rostrhamus sociabilis plumbeus*) and eastern indigo snake (*Drymarchon corais couperi*), as well as the federally protected plants listed at the link for Palm Beach County at our web site ([http://www.fws.gov/verobeach/Species_lists/PDF-lists/Palm Beach County.pdf](http://www.fws.gov/verobeach/Species_lists/PDF-lists/Palm%20Beach%20County.pdf)). Accordingly, the Service recommends that the Florida Department of Transportation (FDOT) prepare a Biological Assessment for the project (as required by 50 CFR 402.12) during the FDOT's Project Development and Environment process.

Service Comments, Fish and Wildlife Resources, Wetlands, and Special Designations:

Corridor 1 would follow Palm Beach County's Persimmon Boulevard Extension corridor and proceed straight northward from the M-Canal approximately 3 miles to North Lake Avenue. The Service notes that Corridor 1 would impact wetlands and uplands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the proposed Persimmon Boulevard Extension and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beach's Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands and uplands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

The Service was involved in the review of the Palm Beach Countys Persimmon Boulevard Extension project (also known as the Acreage Reliever Road). We worked with the County, and the U.S. Army Corps of Engineers (Corps) to develop an alignment that would minimize fragmentation of fish and wildlife habitat by locating the corridor as far to the west as possible. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). Our planning effort resulted in the adoption by Palm Beach County of the Persimmon Boulevard Extension corridor as illustrated in Figures 1-4 provided in the Project Description. It was our understanding that the extension of State Road 7 to Northlake Boulevard would consist of extending the Persimmon Boulevard corridor as illustrated in Alternatives 1 or 3. Accordingly, we were surprised to now see Coridors 2 and 4 proposed as alternatives for the project. Based on information from Palm Beach County's consultant, it was the Service's understanding that the portion of the FDOT right-of-way that is adjacent to the Section 1 mitigation parcel was included as mitigation for the Persimmon Boulevard Extension Project. The inclusion of this portion of the right-of-way was the basis for the Service's concurrence letter to the Corps on the Persimmon Boulevard Extension project (see Attachments 1 and 2 in Additional Comments section). Without the inclusion of the FDOT right-of-way as part of the mitigation plan, the Service would have not provided a concurrence letter to the Corps at that time.

The Service notes that the construction of a new roadway to extend State Road 7 in the project area could result in a variety of adverse impacts to fish and wildlife including: the direct loss of habitat, mortality due to collisions with vehicles, increased disturbance and a reduction in habitat quality adjacent to the roadway, and the fragmentation of existing habitat. The Service believes that Corridor 1 would result in the least impacts to fish and wildlife habitat, wetlands, and conservation lands of the four corridors proposed. The Project Description indicates that Corridor 1 is proposed to be discarded. We strongly urge that Corridor 1 be maintained as an alternative and adopted as the preferred alternative for the project.

To reduce the potential for wildlife mortality resulting from collisions with motor vehicles, the Service requests that the roadway corridor be fenced along its eastern boundary to prevent wildlife from entering the roadway. The fence should consist of a 10-foot tall chain-link with a 2-foot-wide section of angled barbed wire at the top. The base of the fence should include a barrier constructed of hardware cloth (or other suitable material) of sufficiently small mesh size and height to prevent small animals (frogs, snakes etc.) from passing through the fence and entering the roadway. In lieu of a fence, a 10-foot tall barrier wall could be constructed along the eastern boundary of the road right-of-way. The construction of a barrier wall is preferable to a fence because it would reduce road noise and disturbance to wildlife. The construction of a barrier wall is also preferable to the construction of a dike because the barrier wall would reduce the size of the project footprint and inturn impacts to valuable natural resources.

Subject FDOT ROW

John:

Sorry for any confusion. The FDOT ROW has always been intended to be released to Palm Beach County as we discussed in the field. My e-mail on July 25 was not meant to confuse you. Deeded Conservation easement contains 544 acres=/. The FDOT ROW -- 80.6 acres (24-25 acres lie in Section 1 and the balance in Sections 12 & 13) will be incorporated into the Pond Cypress Preserve .The Corps draft SOF states this ROW is forthcoming. I spoke with Brandon yesterday and he told me we have enough mitigation. I tried to get a conference call to you not realizing your office was holding an all day staff meeting. Let me know if I can do anything to clear up any miscommunication I am responsible for, Thanks for calling me this morning at my office. I have been in the field and the best way to reach me is my cell at 561 -662-8849.

Regards,
Jim

Attention: Brandon Howard

Service Log No.: 4-1-05-1 -9856

Corps Application No.: SAJ-2002-8273 (IP-KBH)

Date Received: August 14,2005

Project : Acreage Reliever Road

Applicant: Palm Beach County

County:Palm Beach County

Dear Mrs. Evans:

The Fish and Wildlife Service (Service) has reviewed your Public Notice and other information submitted by the U.S. Army Corps of Engineers (Corps) for the application referenced above. This letter is submitted in accordance with section 7 of the Endangered Species Act of 1973, as amended (87 Stat. 884; 16 U.S.C. 1531 et seq.) and the provisions of the Fish and Wildlife Coordination Act of 1958, as amended (48 Stat. 401 ; 16 U.S.C. 661 et seq.).

PROJECT DESCRIPTION

The applicant proposes to construct a new four-lane roadway, known as the "Acreage Reliever Road," from Okeechobee Boulevard to 60th Street. The purpose of the project is to improve traffic flow in the area. The project will impact a total of 106 acres of wetlands. Wetlands at the project site consist of hydric pine (*Pinus elliottii*) flatwoods, wet prairie, and cypress (*Taxodium distichum*) wetlands. Some of the wetlands in the project site have been impacted by melaleuca (*Melaleuca quinquenervia*). As compensation for impacts to wetlands, the applicant had proposed to preserve and enhance 624.6 acres of high-quality wetlands and uplands within Sections 1, 12, 13, and 24, Township 43 South, Range 41 East, and to preserve and enhance 33.3 acres of uplands and wetlands west of the project corridor from 40th Street to 60th Street. Enhancement activities will consist of removal of exotic vegetation. The entire mitigation area will be added to Palm Beach County's Pond Cypress Natural Area. The project is located in Sections 1, 12, 13, 14, and 24, Township 43 South, Range 41 East, Palm Beach County, Florida.

Lawrence C. Evans

THREATENED AND ENDANGERED SPECIES

Page 2

Wood stork

The project site is located within the core foraging areas (CFA) (i.e., within 18.6 miles) of four active breeding colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA may reduce foraging opportunities for wood storks. To minimize adverse effects to the wood stork, the Service's Draft Supplemental Habitat Management Guidelines for the Wood Stork in the South Florida Ecological Services Consultation Area (Service 2002) (Guidelines) recommends that the applicant replace wetlands lost due to the action. The compensation plan should include a temporal lag factor, if necessary, to ensure that wetlands provided as compensation adequately replace the wetland functions lost due to the project. Moreover, wetlands offered as compensation should be of the same hydroperiod, and located within the CFA of the affected wood stork colony. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a "Service Approved" mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Corps has determined the project "may affect, but is not likely to adversely affect" the wood stork. In our letter to the Corps, dated December 10, 2005, the Service noted information provided to the Service by the applicant's consultant indicated the wetlands mitigation proposed for the project had been reduced from 624.6 to 544.0 acres. A total of 80.6 acres of land (currently owned by the Florida Department of Transportation) located along the east side of the mitigation parcel had been removed from the mitigation proposal. The Service stated: (1) the compensation was not adequate to offset the loss of foraging habitat to the wood stork, (2) we could not provide concurrence for the Corps' determination, and (3) we recommended the applicant provide an additional 80.6 acres of mitigation in order to fulfill the original mitigation proposal. Based on recent discussions with the applicant's consultant and the Corps, we now understand this information was incorrect and the parcel is still included in the mitigation proposal. The Corps will require the applicant to preserve the 80.6-acre parcel within 1 year of issuance of the permit, and this will be included as a condition of the permit. Based on this new information, the Service believes the wetlands mitigation proposal is now adequate to compensate for the loss of wood stork foraging habitat, and we concur with the Corps' determination for the wood stork.

FISH AND WILDLIFE RESOURCES

The project will result in impacts to 106 acres of wetlands. The applicant proposes to mitigate the loss of wetlands by preserving and enhancing 624.6 acres of high-quality wetlands and uplands near the project site. The Service believes the proposed mitigation is adequate to compensate for the loss of wetlands resulting from the project.

Lawrence C. Evans Page 3

Thank you for allowing us to provide these comments and for your cooperation and effort in protecting federally listed species. If you have any questions regarding this project, please contact John Wrublik at 772-562-3909, extension 282.

Summary Degree of Effect

Recreation Areas Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/25/2007)

Comments:

The GIS Analysis and comments from FDEP indicate that three designated public conservation lands are located within the vicinity of this alignment. As indicated by the Florida Natural Areas Inventory, these lands contain significant natural communities and numerous element occurrences of listed species. These lands are also important in terms of natural function such as flood control, filtering storm water runoff, aquifer recharge, etc. The potential effect of this alignment to these lands is determined to be substantial. If selected, the final design for this alignment will avoid or minimize impacts to these lands, including any proposed acquisition sites in the project area, to the greatest extent practicable, and appropriate mitigation will be provided for unavoidable impacts. In addition, a biological assessment/evaluation (BA/BE) will be completed as part of the project development phase to capture any primary or indirect effects to the public lands and any proposed acquisition sites in the project area.

CLC Commitments and Recommendations:

N/A

Coordinator Feedback: None

- No review submitted from the Federal Highway Administration

Land Use

Coordinator Summary

4 Summary Degree of Effect

Land Use Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/25/2007)

Comments:

Comments from the agencies indicate that this alignment will directly impact 19 acres of wetlands, 12 acre-feet of floodplain, and recreation/open space of the community. Residential areas within the vicinity of this alignment will also be negatively impacted. In addition, this alignment is not addressed within the county's comprehensive plan. Based on these reasons, the summary degree of effect assigned to Land Use for this alignment is substantial. If selected, the final design for this alignment will avoid or minimize land use impacts to the greatest extent practicable, and appropriate mitigation will be provided for unavoidable impacts. FDOT will also coordinate with the local government to ensure the project is consistent with the county's comprehensive plan.

ETAT Reviews for Land Use

4 ETAT Review by Nahir Detizio, Federal Highway Administration (08/10/2006)

Land Use Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Residential areas.

Comments on Effects to Resources:

See secondary and cumulative impacts comments.

Coordinator Feedback: None

3

ETAT Review by Gary Donaldson, FL Department of Community Affairs (08/08/2006)

Land Use Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The Department of Community Affairs (DCA) has reviewed the referenced project and, based on current information, this project (Alternatives 1 and 2) are not addressed within the local governments comprehensive plan. However, Alternative 4 is consistent with the Palm Beach County Future Transportation Map.

The Department is supportive of Alternative 3 as the preferred alignment because adverse environmental impacts to Grassy Waters Preserve and Pond Cypress Natural Area are minimized. Additionally, the proposed alignment is consistent with the recently approved Notice of Proposed Change (NOPC) for the Fox Property Development of Regional Impact (DRI). However, this alternative has not been identified in the local government comprehensive plan. Therefore, if Alternative 3 is selected as the preferred alignment, as per DCA preference, the project should not be advanced into the Department of Transportations Five Year Work Program until the comprehensive plan is amended to reflect the proposed roadway modification.

Staff will make a determination of the consistency of the proposed roadway with the respective comprehensive plan when the comprehensive plan is amended to include the selected roadway alternative on an adopted future transportation map and improvement five year schedule.

Comments on Effects to Resources:

see above

Coordinator Feedback: None

3 ETAT Review by Patricia Masterman, Palm Beach MPO (08/04/2006)

Land Use Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Directly impacts 19 acres of wetlands.

Comments on Effects to Resources:

This alignment will also impact 12 acre-feet of floodplain encroachment as well as slightly decrease recreation/open space.

Additional Comments (optional):

None.

CLC Commitments and Recommendations:

This corridor is in compliance with adopted land use plans and compatible with Local Growth Management Plans.

Coordinator Feedback: None

Mobility

Coordinator Summary

1 Summary Degree of Effect

Mobility Summary Degree of Effect: Enhanced

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Comments from the Palm Beach County MPO indicate that this alignment will enhance connectivity between communities, as well as travel and accessibility for pedestrians, cyclists, and Transportation Disadvantaged citizens. Therefore, the summary degree of effect assigned to Mobility for this alignment is enhanced.

ETAT Reviews for Mobility

1 ETAT Review by Patricia Masterman, Palm Beach MPO (08/04/2006)

Mobility Effect: Enhanced

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Connectivity between Royal Palm Beach and communities to the north would be enhanced.

Comments on Effects to Resources:

Pedestrian and bicycle travel would be enhanced with the building of this roadway.

Additional Comments (optional):

Transportation Disadvantaged citizens would have more accessibility between medical facilities located along Okeechobee Blvd and Northlake Blvd.

CLC Commitments and Recommendations:

It is recommended that bicycle/pedestrian paths be built along the corridor to enhance mobility for bicyclist and pedestrians and to ensure their safety.

Coordinator Feedback:None

- No review submitted from the Federal Highway Administration
- No review submitted from the Federal Transit Administration

Relocation**Coordinator Summary****3** Summary Degree of Effect

Relocation Summary Degree of Effect: Moderate

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Comments from the Palm Beach County MPO indicate that there is strong public opposition to this alignment as the need for right-of-way will relocate 107 residential property owners. Based on these reasons, the summary degree of effect assigned to Relocation for this alignment is moderate.

ETAT Reviews for Relocation**3** ETAT Review by Patricia Masterman, Palm Beach MPO (08/04/2006)

Relocation Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

This alignment will cause the relocation of 107 residential property owners.

Comments on Effects to Resources:

The need for up to 160 acres of right-of-way will create the need for residential relocation.

Additional Comments (optional):

None.

CLC Commitments and Recommendations:

Public workshops held in the community indicates overwhelming opposition to the development of this corridor.

Coordinator Feedback:None

- No review submitted from the Federal Highway Administration

Social**Coordinator Summary****3** Summary Degree of Effect

Social Summary Degree of Effect: Moderate

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

No major social issues are associated with this alignment; however, this alignment is closest to residential areas and public opposition to this alignment has been expressed. As a result, the summary degree of effect assigned to Social for this alignment is determined to be moderate. FDOT will conduct a noise study during project development to assess (and then avoid or minimize) potential noise impacts to residences located within the vicinity of the project.

ETAT Reviews for Social**3** ETAT Review by Nahir Detizio, Federal Highway Administration (08/10/2006)

Social Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

The western alignment (Alternative 1) is closest to residential areas.

Comments on Effects to Resources:

A noise analysis will be needed to determine the level of noise impacts at the noise sensitive locations.

Coordinator Feedback:None

2 ETAT Review by Patricia Masterman, Palm Beach MPO (08/04/2006)

Social Effect: Minimal

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

No impact is indicated by this alignment on underserved populations, minorities, or low income citizens.

Comments on Effects to Resources:

There does not appear to be a major impact on populations falling into minority or low income, and there has not been an issue with moving residents in the past. There may be an impact on traffic patterns through established neighborhoods in the Village of Royal Palm Beach.

Additional Comments (optional):

This alignment may enhance emergency services response time for fire, police and EMS.

CLC Commitments and Recommendations:

Public input has been obtained with some residents objecting to the alignment of roadway.

ETAT Reviews: Secondary and Cumulative

Secondary and Cumulative Effects

Coordinator Summary

4 Summary Degree of Effect

Secondary and Cumulative Effects Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/25/2007)

Comments:

Although this alignment will have lower impacts on natural resources than the other three alignments, the potential indirect and cumulative effects to the environment and community is determined to be substantial. Therefore, the summary degree of effect assigned to Secondary and Cumulative Impacts for this alignment is substantial. If selected, the final design for this alignment will avoid or minimize impacts to natural resources

and the community to the greatest extent practicable, and appropriate mitigation will be provided for unavoidable impacts.

ETAT Reviews for Secondary and Cumulative Effects

3 ETAT Review by Alisa Zarbo, US Army Corps of Engineers (08/22/2006)

Secondary and Cumulative Effects Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

At-Risk Resource: Wetlands

Comments on Effects:

Depending on the alternative, the secondary effects to the wetlands and aquatic habitat could be great.

Recommended Avoidance, Minimization, and Mitigation Measures:

The Corps must first agree on the preferred alternative for the alignment, then avoid and minimize wetland impacts, and finally mitigate. Early coordination on the preferred alternative is extremely important in this project so that the Corps can continue to process the application and demonstrate avoidance and minimization.

Recommended Actions to Improve At-Risk Resources:

Initial coordination with the Corps on the selected alternative is important.

Coordinator Feedback: None

4 ETAT Review by Nahir Detizio, Federal Highway Administration (08/10/2006)

Secondary and Cumulative Effects Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

At-Risk Resource: Wetlands

Comments on Effects:

Each of the alternatives have varying amounts of secondary impacts on land use and cumulative impacts on wetlands/water and habitat resources.

The environmental document should assess these secondary impacts of the alternatives, as well as cumulative impacts to the areas wetland/water and habitat resources from all area development that is reasonably foreseeable to occur.

Recommended Avoidance, Minimization, and Mitigation Measures:

None found.

Recommended Actions to Improve At-Risk Resources:

None found.

At-Risk Resource:Wildlife and Habitat**Comments on Effects:**

Each of the alternatives have varying amounts of secondary impacts on land use and cumulative impacts on wetlands/water and habitat resources.

The environmental document should assess these secondary impacts of the alternatives, as well as cumulative impacts to the areas wetland/water and habitat resources from all area development that is reasonably foreseeable to occur.

Recommended Avoidance, Minimization, and Mitigation Measures:

None found.

Recommended Actions to Improve At-Risk Resources:

At-Risk Resource:Land Use**Comments on Effects:**

The Alternative 1 (western) alignment has substantial secondary land use impacts primarily on the residential areas.

Recommended Avoidance, Minimization, and Mitigation Measures:

None found.

Recommended Actions to Improve At-Risk Resources:

None found.

Coordinator Feedback:None

Secondary and Cumulative Effects Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

At-Risk Resource: Wildlife and Habitat

Comments on Effects:

Secondary and cumulative impacts would be substantial due to increased residential and commercial development on land along the highway due to improved access. The roadway extension will also result in increased roadkills for many species of mammals, amphibians and reptiles, and some wading bird species. The expanded roadway would create a more formidable barrier to wildlife movement, and also result in habitat fragmentation and isolation. Increased stormwater runoff from the expanded impervious roadway surface could degrade the water quality of existing wetlands along the ROW in the project area. Since one public land tract is immediately adjacent to the corridor, this action will potentially have moderate secondary impacts on public lands.

Recommended Avoidance, Minimization, and Mitigation Measures:

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we recommend the selection of Corridor 1, which will have significantly lower impacts on natural resources.

Recommended Actions to Improve At-Risk Resources:

Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate and supported by our agency. The PD&E Study should also include an investigation of the design, cost, location, and construction techniques for longer bridges over streams or sloughs, canals and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.

Floodplains

Coordinator Summary

3 Summary Degree of Effect

Floodplains Summary Degree of Effect: Moderate

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The EST GIS Analysis shows the following acreage of a FEMA FIRM floodzone within the project's 500-foot buffer. (A 500-foot buffer was used due to the proposed new 6-lane divided alignment):
Zone A (113 acres): an area inundated by 100-year flooding for which no base elevations have been determined. Zone AO (53 acres): an area inundated by 100-year flooding for which average depths have been determined. Zone X500 (772 acres): an area inundated by 100-year flooding with average depths of less than 1 foot or with drainage areas less than one square mile.
Based on these results, 100 percent of the 500-foot buffer for this alternative occurs within a designated floodzone. A Location Hydraulics Report will be prepared for the project and the project will be designed to minimize floodplain impacts and compensate for potential floodplain encroachments. For these reasons, the summary degree of effect assigned to Floodplains is moderate.

FDOT District 4 (4/24/2007)

Comments:

According to the EST GIS Analysis, Alternative 2 is immediately adjacent to both the Pond Cypress Natural Area and Grassy Waters Preserve for most of its length. In addition, the Loxahatchee Slough Natural Area is located within one-quarter mile of the northern terminus of Alternative 2. For these reasons, and as a result of the Dispute Resolution process, Alternative 2 has been dropped as an alternative.

ETAT Reviews for Special Designations

5

ETAT Review by John Wrublik, US Fish and Wildlife Service (07/05/2006)

Special Designations Effect: Dispute Resolution

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:

"Dispute Support" options were not available at the time of the review.

Identified Resources and Level of Importance:

Public Conservation Lands

Comments on Effects to Resources:

Corridor 2 begins at the northwest corner of the Baywinds development and the intersection of the proposed Roebuck Road and proceeds northward along the Florida Department of Transportation (FDOT) right-of-way for about 2.5 miles. The corridor then heads diagonally to the northwest through the middle of Section 1 to approximately the intersection of 60th Street and the M-Canal. From the M-Canal the corridor proceeds north approximately 3 miles to North Lake Avenue. The project description indicates that Corridor 2 is proposed to be discarded. The Service notes that Corridor 2 would result in significant adverse impacts to fish and wildlife habitat located in the Pond Cypress Natural Area and Section 1. We further note that Section 1 was offered as mitigation by Palm Beach County for impacts to wetlands resulting the Persimmon Boulevard Extension. We do not believe that it is appropriate to construct a new roadway through a wetlands mitigation area. Accordingly, we cannot support the use of Corridor 2 for the project and strongly urge that it be eliminated from further consideration.

Water Quality and Quantity

Coordinator Summary

4 Summary Degree of Effect

Water Quality and Quantity Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Because of the concerns stated by FDEP, notably the presence of the City of West Palm Beach Water Catchment Area immediately adjacent to the project, the summary degree of effect assigned to Water Quality and Quantity is substantial.

ETAT Reviews for Water Quality and Quantity

4 ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Water Quality and Quantity Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Stormwater runoff from the road surface may alter adjacent wetlands and surface waters through increased pollutant loading. Natural resource impacts within and adjacent to the proposed road right-of-way will likely include alteration of the existing surface water hydrology and natural drainage patterns, and reduction in flood attenuation capacity of area creeks, ditches, and sloughs as a result of increased impervious surface within the watershed. Every effort should be made to maximize the treatment of stormwater runoff from the proposed road project to prevent ground and surface water contamination. Stormwater treatment should be designed to maintain the natural pre-development hydroperiod and water quality, as well as to protect the natural functions of adjacent wetlands.

Comments on Effects to Resources:

We recommend that the study include an evaluation of existing stormwater treatment adequacy and details on the future stormwater treatment facilities. Retro-fitting of stormwater conveyance systems would help reduce impacts to water quality. Increased stormwater runoff carrying oils, greases, metals, sediment, and other pollutants from the increased impervious surface would be of significant concern.

Additional Comments (optional):

The Water Catchment Area for the City of West Palm Beach is immediately adjacent to the project. All activities must be designed to prevent stormwater pollutant contamination of the City's water supply. DEP recommends that the FDOT work to include the City on all decisions affecting this critical area.

Coordinator Feedback: None

- No review submitted from the US Environmental Protection Agency
- No review submitted from the Federal Highway Administration
- No review submitted from the South Florida Water Management District

Coordinator Summary

5 Summary Degree of Effect

Wetlands Summary Degree of Effect: Dispute Resolution

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The following acreage of wetlands and open water habitats are reported by the ETDM GIS Analysis within the 500-foot buffer for this alternative:

National Wetlands Inventory database - 419.2 acres; Wetlands 2000 database - 346.9 acres; 2003 FFWCC Habitat and Landcover Grid database - 443.4 acres.

The proposed project is a 6-lane divided highway that would occupy much of the 500-foot buffer. Because of the concerns expressed by the agencies, the large area of wetlands occurring within the 500-foot buffer, and as a result of the Dispute Resolution process, Alternative 2 has been dropped as an alternative.

ETAT Reviews for Wetlands

4 ETAT Review by Alisa Zarbo, US Army Corps of Engineers (08/22/2006)

Wetlands Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Wetlands: This area was evaluated and considered in the permitting of the Acreage Reliever Road and has an extremely high level of importance to the Corps. Wildlife corridors were incorporated into the alignment of the Acreage Reliever Road. The Corps would try to keep the same continuity of the corridors when permitting this extension.

Comments on Effects to Resources:

If the roadway was constructed through corridor 4, it would fragment an extremely sensitive greenway and wildlife corridor that exists between the PCNA, the WCA and Section 1. The alignment would isolate the PCNA and the WCA to the extent that reptiles, amphibians and small and large mammals could not easily access the adjacent natural areas. Large natural areas are necessary for certain wildlife to carry out life functions such as feeding and nesting. Smaller isolated areas may accommodate only a few individuals with modest home range requirements. Small mammals and other forest dwelling wildlife have shown an aversion to using areas with less vegetative cover. This would be the case with a four-lane roadway that has a shoulder and median. Although some animals have an aversion to roadways, many attempt to cross and result in collisions that impact both wildlife and humans. During 1990, 431 vehicle collisions with animals (wild and domestic) were serious enough to be reported to the Florida Department of Highway Safety and Motor Vehicles. These accidents resulted in 4 human fatalities and 380 injuries. The average estimated property damage for each accident was \$3,395. Corridor 4 could result in extensions, as shown in the Conceptual Analysis Matrix, to access the Acreage. These extensions further fragment the ecosystem and isolate Section 1. Placing the roadway down the Rangeline would put it adjacent to the WCA. The WCA is a Class I potable water supply for the City of West Palm Beach. The roadway run-off would pose serious threats to the City's drinking water supply. The alternative of using a bridge along the Rangeline would not be a feasible alternative due to it being adjacent to the WCA.

Up to 60th Street, Corridor 3 has been approved by the Corps. From 60th Street the roadway is shown going east along the M-Canal. This portion and the following north south portion of the roadway that ends

at Northlake Boulevard would isolate the mitigation area for the Ibis Golf and Country Club. Requirements for the portion of the roadway adjacent to the mitigation area would include fencing on both sides of the roadway, culverts to maintain adequate hydrology, slower speed limits, wildlife crossing signs and culverts for wildlife crossings or bridges. The wildlife crossings should be placed above the seasonal high water elevation of wetlands but adjacent to wetlands. Wildlife crossings should be placed just above the ecotone of the wetland. The median should also be devoid of vegetation that would give the illusion of a narrow roadway to wildlife. Wildlife is more adverse to crossing wider roadways. Median landscaping plants should not provide a food source for wildlife. This would entice wildlife to cross the roadway and go into the median for food resulting in road kill. This area is within the Loxahatchee River Watershed and to a limited extent the Lake Worth Lagoon.

Additional Comments (optional):

Mitigation efforts should be concentrated in the same watershed. Mitigation options could include widening of the M-Canal and planting a flow through marsh to improve water quality. Mitigation in the WCA may be appropriate for this project.

4

ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Wetlands Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The National Wetlands Inventory GIS report indicates that there are 419.22 acres of palustrine and 1.72 acres of riverine wetlands within the 500-ft. project buffer zone. The Wetlands 2000 report indicates that there are 371.70, 24.75, 19.54, 1,947.87, 204.38, 406.89, 25.98, 868.61, 17.36 and 488.65 acres of cypress, cypress domes, emergent aquatic vegetation, freshwater marsh, mixed shrubs, mixed wetland hardwoods, wet melaleuca, wet pinelands, wet prairies and mixed wetland forests, respectively, within the 5,280-ft. buffer of the project area.

Comments on Effects to Resources:

The project will require an environmental resource permit (ERP) from the South Florida Water Management District. The ERP applicant will be required to eliminate or reduce the proposed wetland resource impacts of the roadway extension project to the greatest extent practicable:

- Minimization should emphasize avoidance-oriented corridor alignments, wetland fill reductions via pile bridging and median width reductions within safety limits.
- Wetlands should not be displaced by the installation of stormwater conveyance and treatment swales; compensatory treatment in adjacent uplands is the preferred alternative. All stormwater treatment should be located in upland sites.
- After avoidance and minimization have been exhausted, mitigation must be proposed to offset the adverse impacts of the project to existing wetland functions and values. Significant attention is given to forested wetland systems, which are difficult to mitigate.
- The cumulative impacts of concurrent and future road improvement projects in the vicinity of the subject project should also be addressed.

Additional Comments (optional):

DEP ranks the Corridor 2 Alternative as # 4. Staff has expressed concerns regarding the extreme fragmentation of wildlife habitat by the proposed roadway. The Department strongly recommends bridging ALL wetland crossings to minimize impacts to wetland connectivity/hydroperiod and wildlife corridor functions. Additionally, all stormwater should be conveyed to treatment sites located in upland areas.

Wetlands Effect: Dispute Resolution

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:

"Dispute Support" options were not available at the time of the review.

Identified Resources and Level of Importance:

wetlands

Comments on Effects to Resources:

Corridor 2 begins at the northwest corner of the Baywinds development and the intersection of the proposed Roebuck Road and proceeds northward along the Florida Department of Transportation (FDOT)

right-of-way for about 2.5 miles. The corridor then heads diagonally to the northwest through the middle of Section 1 to approximately the intersection of 60th Street and the M-Canal. From the M-Canal the corridor proceeds north approximately 3 miles to North Lake Avenue. The project description indicates that Corridor 2 is proposed to be discarded. The Service notes that Corridor 2 would result in significant adverse impacts to fish and wildlife habitat located in the Pond Cypress Natural Area and Section 1. We further note that Section 1 was offered as mitigation by Palm Beach County for impacts to wetlands resulting the Persimmon Boulevard Extension. We do not believe that it is appropriate to construct a new roadway through a wetlands mitigation area. Accordingly, we cannot support the use of Corridor 2 for the project and strongly urge that it be eliminated from further consideration.

Summary Degree of Effect

Wildlife and Habitat Summary Degree of Effect: Dispute Resolution

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Both the FFWCC and USFWS indicated that several state and federally listed species may occur within the project area. Although no listed species occurrences are reported within the 500-foot buffer for this alternative, there is a high likelihood of occurrence of listed wading birds and wood storks because of the large area of wetlands present along this alignment. This alternative is also located within publicly owned conservation lands. In addition, the 500-foot buffer for this alternative contains pineland that requires prescribed burning for habitat management. For these reasons, and as a result of the Dispute Resolution process, Alternative 2 has been dropped as an alternative.

ETAT Reviews for Wildlife and Habitat

4

ETAT Review by Scott Sanders, FL Fish and Wildlife Conservation Commission (08/04/2006)

Wildlife and Habitat Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

The Habitat Conservation Scientific Services Section of the Florida Fish and Wildlife Conservation Commission (FWC) has coordinated an agency review of ETDM #8127 in Palm Beach County, and provides the following comments related to potential impacts to fish and wildlife resources for this Programming Phase project.

The proposed project involves the evaluation of the need to extend SR 7 from SR 704 (Okeechobee Boulevard) to Northlake Boulevard in Palm Beach County. Four corridors and a No-Build option have been identified for the project.

Corridor 2 would begin at the intersection of Okeechobee Boulevard and SR 7, and proceed north within FDOTs existing Right-of-way (ROW). The alignment first turns to the northwest, and then north, adjacent to and parallel to 110th Avenue. The alignment crosses the M canal, and continues north on the west side of the Ibis Golf and Country Club, and terminates at Northlake Boulevard.

This project was reviewed under the Advanced Notification process through the Florida State Clearinghouse at the Florida Department of Environmental Protection under SAI FL200506231187C (letter dated August 10, 2005, attached), and SAI# 9811160726C (letter dated December 2, 1998, attached). These FWC letters provide a detailed overview of project resources, including listed wildlife and plant species, potential impacts, and a course of action to reduce these impacts. We have reviewed these letters, and our previous comments remain applicable to the currently proposed project.

A GIS analysis of fish and wildlife and habitat resources was conducted using the Environmental Screening Tool (EST), and those results indicate that very similar upland and wetland habitat types are present along all four corridors. Uplands within 500 feet of the proposed Corridor 2 include mixed pine-hardwood forest, pinelands, upland hardwood hammock, and dry prairie. Wetlands along this corridor include cypress swamp, cypress/pine/cabbage palm, freshwater marsh and wet prairie, hardwood swamp, mixed wetlands forests, open water, sawgrass marsh, and shrub swamp. Approximately 36.0 percent of the land within 500 feet of the corridor is in high and low impact urban land uses.

An overall accounting of the species listed by FWC which may occur in and adjacent to the project area include the eastern indigo snake (Threatened [T]), Florida pine snake Species of Special Concern [SSC]), gopher tortoise (SSC), Shermans fox squirrel (SSC), Florida mouse (SSC), little blue heron (SSC), tricolored heron (SSC), white ibis (SSC), wood stork (E), snail kite (E), bald eagle (T), crested caracara (T), southeastern kestrel (T), limpkin (SSC), Florida sandhill crane (T), Florida burrowing owl (SSC), and red-cockaded woodpecker (SSC). The presence or absence of some of these species within the project area is highly dependent on habitat type, plant successional stage, habitat quality, and site drainage conditions.

Habitat quality within 500 feet of the Right-of-way (ROW) for Corridor 2 was evaluated using natural resource data layers in the EST. FWCs Biodiversity Hotspots data layer shows that 33.0 percent of the area is capable of supporting three to four focal species. According to FWCs Integrated Wildlife Habitat Ranking System map, a total of 45.0 percent of this zone along the corridor has been assigned a score of from 6 to 8 (Scale 1 = Low, 10 = High), which ranks as good to excellent quality. According to FWCs Priority Wetlands Map for wetlands dependent listed species, approximately 47.8 percent of the habitat along the proposed roadway zone is ranked as capable of supporting 1 to 3 focal species in uplands, and 4 to 6 focal species in wetlands. Within this zone, public and managed lands include the Grassy Waters Preserve, and the Pond Cypress Natural Area. Strategic Habitat Conservation Areas for the limpkin and wading birds have also been designated within approximately 32.2 percent of this zone along Corridor 2. Corridor 2 has the second highest acreage of wetlands of the four corridors.

Comments on Effects to Resources:

Direct impacts to fish and wildlife from this proposed project corridor would be substantial due to the significant amount of quality wetlands and uplands found along the corridor. Impacts would include habitat

loss from roadway and Drainage Retention Area (DRAs) construction, which could adversely affect a number of listed wildlife species. Due to the close proximity of two public land tracts, this corridor would potentially have a high direct impact on public lands.

Additional Comments (optional):

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we recommend the selection of Corridor 1, which would have less impact on natural resources.

We recommend the following measures be considered during the Project Development and Environment (PD&E) Study to avoid, minimize, and mitigate project impacts to listed species and habitat:

1. A vegetative cover map and accounting by acreage for each plant community type should be made for the affected project area. Compensatory mitigation for all upland and wetlands habitat loss should be required. If wetlands are mitigated under the provisions of Chapter 373.4137 F.S., the proposed mitigation sites should be located within the immediate or same regional area, functionally equivalent, equal to or of higher functional value, and as or more productive as the wetlands impacted by the project.
2. Surveys for listed species should be performed within and adjacent to the ROW and proposed sites for DRAs during the PD&E Study. The methodology for these surveys should be coordinated with FWC, and follow appropriate survey techniques or guidelines to determine presence, absence or probability of occurrence of various species, and to assess habitat quality. These study methods should be designed considering the potential listed species discussed above.
3. Based on the survey results, a plan should also be developed to address direct, secondary, and cumulative impacts of the project on wildlife and habitat resources, including listed species. Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate and supported by our agency.
4. The PD&E Study should also include an investigation of the design, cost, location, and construction techniques for longer bridges over sloughs, canals and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.
5. Habitat impacts in both uplands and wetlands may be avoided where possible by interchangeably designing the road expansion along those areas where less habitat resources occur. In addition, using the median and roadside swales for treating roadside runoff would reduce the need for some off-site DRAs, and assist in reducing habitat loss.
6. Construction equipment staging areas; storage of oils, greases, and fuel; fill and roadbed material; and vehicle maintenance activities should be sited in previously disturbed areas far removed from streams, wetlands, or surface water bodies. Staging areas, along with borrow areas, should also be surveyed for listed species.

We appreciate the opportunity to provide input on highway design and the conservation of fish and wildlife resources. Please contact Steve Lau in our Vero Beach Office at (772) 778-5094 for further coordination on this project.

Wildlife and Habitat Effect: Dispute Resolution

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:

"Dispute Support" options were not available at the time of the review.

Identified Resources and Level of Importance:

Federally Listed Species and Fish and Wildlife Habitat

Comments on Effects to Resources:

Service Comments, Federally Listed Species: The Service has reviewed our Geographic Information Systems (GIS) database for recorded locations of federally listed threatened and endangered species on or adjacent to the project study area. The GIS database is a compilation of data received from several sources.

Wood Stork

The project corridor is located in the Core Foraging Areas (within 18.6 miles) of three active nesting colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA due to an action could result in the loss of foraging habitat for the wood stork. To minimize adverse effects to the wood stork, we recommend that any lost foraging habitat resulting from the project be replaced within the CFA of the affected nesting colony. Moreover, wetlands provided as mitigation should adequately replace the wetland functions lost as a result of the action. The Service does not consider the preservation of wetlands, by itself, as adequate compensation for impacts to wood stork foraging habitat, because the habitat lost is not replaced. Accordingly, any wetland mitigation plan proposed should include a restoration, enhancement, or creation component. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a Service Approved mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Service believes that the following federally listed species have the potential to occur in or near the project site: wood stork, Everglade snail kite (*Rostrhamus sociabilis plumbeus*) and eastern indigo snake (*Drymarchon corais couperi*), as well as the federally protected plants listed at the link for Palm Beach County at our web site ([http://www.fws.gov/verobeach/ Species_lists/ PDF-lists/Palm Beach County.pdf](http://www.fws.gov/verobeach/Species_lists/PDF-lists/Palm%20Beach%20County.pdf)). Accordingly, the Service recommends that the Florida Department of Transportation (FDOT) prepare a Biological Assessment for the project (as required by 50 CFR 402.12) during the FDOTs Project Development and Environment process.

Service Comments, Fish and Wildlife Resources, Wetlands, and Special Designations:

Corridor 2 begins at the northwest corner of the Baywinds development and the intersection of the proposed Roebuck Road and proceeds northward along the Florida Department of Transportation (FDOT) right-of-way for about 2.5 miles. The corridor then heads diagonally to the northwest through the middle of Section 1 to approximately the intersection of 60th Street and the M-Canal. From the M-Canal the corridor proceeds north approximately 3 miles to North Lake Avenue. The project description indicates that Corridor 2 is proposed to be discarded. The Service notes that Corridor 2 would result in significant

adverse impacts to fish and wildlife habitat located in the Pond Cypress Natural Area and Section 1. We further note that Section 1 was offered as mitigation by Palm Beach County for impacts to wetlands resulting the Persimmon Boulevard Extension. We do not believe that it is appropriate to construct a new roadway through a wetlands mitigation area. Accordingly, we cannot support the use of Corridor 2 for the project and strongly urge that it be eliminated from further consideration.

FDOT District 4 (4/25/2007)

Comments:

The GIS Analysis and comments from FDEP indicate that three designated public conservation lands are located within the vicinity of this alignment. As indicated by the Florida Natural Areas Inventory, these lands contain significant natural communities and numerous element occurrences of listed species. These lands are also important in terms of natural function such as flood control, filtering storm water runoff, aquifer recharge, etc. The potential impact of this alignment to these lands is determined to be substantial as it will cause wildlife habitat fragmentation.

ETAT Reviews for Recreation Areas

4 ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Recreation Areas Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

The following public conservation lands are located in the vicinity of this project: the Grassy Waters Preserve, Loxahatchee Slough Natural Area and Pond Cypress Natural Area.

Comments on Effects to Resources:

These lands contain significant natural communities and numerous element occurrences of listed species, as indicated by the Florida Natural Areas Inventory. The Department is interested in preserving the area's natural communities, wildlife corridor functions, natural flood control, stormwater runoff filtering capabilities, aquifer recharge potential, contributions to regional spring complexes, and recreational trail opportunities. Therefore, future environmental documentation should include an evaluation of the primary, secondary, and cumulative impacts of the proposed roadway widening construction on the above public lands and any proposed acquisition sites.

Additional Comments (optional):

Staff has expressed concerns regarding the extreme fragmentation of wildlife habitat by the proposed roadway. The Department strongly recommends bridging ALL wetland crossings to minimize impacts to wetland connectivity/hydroperiod and wildlife corridor functions.

ETAT Reviews for Secondary and Cumulative Effects

3 ETAT Review by Alisa Zarbo, US Army Corps of Engineers (08/22/2006)

Secondary and Cumulative Effects Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

At-Risk Resource:Wetlands

Comments on Effects:

Depending on the alternative, the secondary effects to the wetlands and aquatic habitat could be great.

The Corps assesses secondary effects by evaluating the change in wetland function and value both before and after the road is constructed.

Recommended Avoidance, Minimization, and Mitigation Measures:

The Corps must first agree on the preferred alternative for the alignment, then avoid and minimize wetland impacts, and finally mitigate. Early coordination on the preferred alternative is extremely important in this project so that the Corps can continue to process the application and demonstrate avoidance and minimization.

Recommended Actions to Improve At-Risk Resources:

Initial coordination with the Corps on the selected alternative is important.

Coordinator Feedback:None

4

ETAT Review by Scott Sanders, FL Fish and Wildlife Conservation Commission (08/04/2006)

Secondary and Cumulative Effects Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

At-Risk Resource:Wildlife and Habitat

Comments on Effects:

Secondary and cumulative impacts would be substantial due to increased residential and commercial development along the highway due to improved access. The roadway extension will also result in increased roadkills for many species of mammals, amphibians and reptiles, and some wading bird species. The expanded roadway will create a more formidable barrier to wildlife movement, and also result in habitat fragmentation and isolation. Increased stormwater runoff from the expanded impervious roadway surface could degrade the water quality of existing wetlands and streams along the ROW in the project area. Due to the close proximity of two public land tracts, this corridor will potentially have high secondary impacts on public lands.

Recommended Avoidance, Minimization, and Mitigation Measures:

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we recommend the selection of Corridor 1, which will have less impact on natural resources.

Recommended Actions to Improve At-Risk Resources:

Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate and supported by our agency.

The PD&E Study should also include an investigation of the design, cost, location, and construction techniques for longer bridges over sloughs, canals and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail

deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.

3 Summary Degree of Effect

Floodplains Summary Degree of Effect: Moderate

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The EST GIS Analysis shows the following acreage of a FEMA FIRM floodzone within the project's 500-foot buffer. (A 500-foot buffer was used due to the proposed new 6-lane divided alignment):
Zone A (158 acres): an area inundated by 100-year flooding for which no base elevations have been determined. Zone X500 (469 acres): an area inundated by 100-year flooding with average depths of less than 1 foot or with drainage areas less than one square mile.
Based on these results, 100 percent of the 500-foot buffer for this alternative occurs within a designated floodzone. A Location Hydraulics Report will be prepared for the project and the project will be designed to minimize floodplain impacts and compensate for potential floodplain encroachments. For these reasons, the summary degree of effect assigned to Floodplains is moderate.

FDOT District 4 (4/24/2007)

Comments:

According to the EST GIS Analysis, the southern terminus of Alternative 3 is adjacent to the Pond Cypress Natural Area. This alternative is also immediately adjacent to the Grassy Waters Preserve for most of its length. In addition, the northern terminus of Alternative 3 is located within 200 feet of the Loxahatchee Slough Natural Area. For these reasons, and because of the concerns stated by the USFWS, the summary degree of effect assigned to Special Designations is substantial.

ETAT Reviews for Special Designations

4 ETAT Review by John Wrublik, US Fish and Wildlife Service (07/05/2006)

Special Designations Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Public Conservation Lands

Comments on Effects to Resources:

Corridor 3 would follow Palm Beach Countys Persimmon Boulevard Extension and proceed east at the M-Canal for about 0.75 miles. The Corridor would then head northward for about 3 miles along the FDOT alignment to Northlake Avenue. The Service notes that Corridor 3 would directly impact uplands and wetlands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the Persimmon Boulevard Extension and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beachs Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

The northern segment of Corridor 3 borders the City of Palm Beachs Water Catchment Area. The Service believes that Corridor 3 will result in the direct loss of moderate quality habitat within the this section of the FDOT right-of-way. The Service also believes that Corridor 3 will result in significant adverse indirect

effects to Fish and Wildlife in the City of West Palm Beachs Water Catchment Area. These effects would consist of disturbance from vehicle noise and vehicle and roadway lights.

Based on the impacts of to fish and wildlife habitat, wetlands, and public conservation lands, we cannot support Corridor 3 as the preferred alternative for the project. We recommend that the FDOT adopt Corridor 1 as the preferred alternative for the project.

Because of the concerns stated by FDEP, notably the presence of the City of West Palm Beach Water Catchment Area immediately adjacent to the project, the summary degree of effect assigned to Water Quality and Quantity is substantial.

ETAT Reviews for Water Quality and Quantity

4 ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Water Quality and Quantity Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

Stormwater runoff from the road surface may alter adjacent wetlands and surface waters through increased pollutant loading. Natural resource impacts within and adjacent to the proposed road right-of-way will likely include alteration of the existing surface water hydrology and natural drainage patterns, and reduction in flood attenuation capacity of area creeks, ditches, and sloughs as a result of increased

impervious surface within the watershed. Every effort should be made to maximize the treatment of stormwater runoff from the proposed road project to prevent ground and surface water contamination. Stormwater treatment should be designed to maintain the natural pre-development hydroperiod and water quality, as well as to protect the natural functions of adjacent wetlands.

Comments on Effects to Resources:

We recommend that the study include an evaluation of existing stormwater treatment adequacy and details on the future stormwater treatment facilities. Retro-fitting of stormwater conveyance systems would help reduce impacts to water quality. Increased stormwater runoff carrying oils, greases, metals, sediment, and other pollutants from the increased impervious surface would be of significant concern.

Additional Comments (optional):

The Water Catchment Area for the City of West Palm Beach is immediately adjacent to the project. All activities must be designed to prevent stormwater pollutant contamination of the City's water supply. DEP recommends that the FDOT work to include the City on all decisions affecting this critical area.

Wetlands

Coordinator Summary

4 Summary Degree of Effect

Wetlands Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The following acreage of wetlands and open water habitats are reported by the ETDM GIS Analysis within the 500-foot buffer for each alternative:

National Wetlands Inventory database - 312.8 acres; Wetlands 2000 database - 314.1 acres; 2003 FFWCC Habitat and Landcover Grid database - 204.4 acres.

The proposed project is a 6-lane divided highway and would occupy much of the 500-foot buffer. Because of the large area of wetlands occurring within the 500-foot buffer, a Wetlands DOE of Substantial is recommended for this project alternative.

ETAT Reviews for Wetlands

4 ETAT Review by Alisa Zarbo, US Army Corps of Engineers (08/22/2006)

Wetlands Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Wetlands: This area was evaluated and considered in the permitting of the Acreage Reliever Road and has an extremely high level of importance to the Corps. Wildlife corridors were incorporated into the alignment of the Acreage Reliever Road. The Corps would try to keep the same continuity of the corridors when permitting this extension.

Comments on Effects to Resources:

If the roadway was constructed through corridor 4, it would fragment an extremely sensitive greenway and wildlife corridor that exists between the PCNA, the WCA and Section 1. The alignment would isolate the PCNA and the WCA to the extent that reptiles, amphibians and small and large mammals could not easily access the adjacent natural areas. Large natural areas are necessary for certain wildlife to carry out life functions such as feeding and nesting. Smaller isolated areas may accommodate only a few individuals with modest home range requirements. Small mammals and other forest dwelling wildlife have shown an aversion to using areas with less vegetative cover. This would be the case with a four-lane roadway that has a shoulder and median. Although some animals have an aversion to roadways, many attempt to cross and result in collisions that impact both wildlife and humans. During 1990, 431 vehicle collisions with animals (wild and domestic) were serious enough to be reported to the Florida Department of Highway Safety and Motor Vehicles. These accidents resulted in 4 human fatalities and 380 injuries. The average estimated property damage for each accident was \$3,395. Corridor 4 could result in extensions, as shown in the Conceptual Analysis Matrix, to access the Acreage. These extensions further fragment the ecosystem and isolate Section 1. Placing the roadway down the Rangeline would put it adjacent to the WCA. The WCA is a Class I potable water supply for the City of West Palm Beach. The roadway run-off would pose serious threats to the City's drinking water supply. The alternative of using a bridge along the Rangeline would not be a feasible alternative due to it being adjacent to the WCA.

Up to 60th Street, Corridor 3 has been approved by the Corps. From 60th Street the roadway is shown going east along the M-Canal. This portion and the following north south portion of the roadway that ends at Northlake Boulevard would isolate the mitigation area for the Ibis Golf and Country Club. Requirements for the portion of the roadway adjacent to the mitigation area would include fencing on both sides of the roadway, culverts to maintain adequate hydrology, slower speed limits, wildlife crossing signs and culverts for wildlife crossings or bridges. The wildlife crossings should be placed above the seasonal high water elevation of wetlands but adjacent to wetlands. Wildlife crossings should be placed just above the ecotone of the wetland. The median should also be devoid of vegetation that would give the illusion of a narrow roadway to wildlife. Wildlife is more adverse to crossing wider roadways. Median landscaping plants should not provide a food source for wildlife. This would entice wildlife to cross the roadway and go into the median for food resulting in road kill. This area is within the Loxahatchee River Watershed and to a limited extent the Lake Worth Lagoon.

Additional Comments (optional):

Mitigation efforts should be concentrated in the same watershed. Mitigation options could include widening of the M-Canal and planting a flow through marsh to improve water quality. Mitigation in the WCA may be appropriate for this project.

Comments on Effects to Resources:

NONE

Additional Comments (optional):

Based on the project location and information provided on the ETDM website, NOAA's National Marine Fisheries Service (NOAA Fisheries) concludes the proposed work would not directly impact areas that support NOAA trust resources. We have no comments or recommendations to provide pursuant to the essential fish habitat (EFH) requirements of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) P.L. 104-297. Further consultation on this matter is not necessary unless future modifications are proposed and you believe that the proposed action may result in adverse impacts to EFH.

Coordinator Feedback: None

4 ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Wetlands Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The National Wetlands Inventory GIS report indicates that there are 304.51 acres of palustrine and 8.27 acres riverine wetlands within the 500-ft. project buffer zone. The Wetlands 2000 report indicates that there are 174.21, 6.64, 17.65, 1855.25, 485.76, 26.59, 1308.18, 8.07 and 107.44 acres of cypress, cypress domes, emergent aquatic vegetation, freshwater marsh, mixed shrubs, mixed wetland hardwoods, wet pinelands, wet prairies and mixed wetland forests, respectively, within the 5,280-ft. buffer of the project area.

Comments on Effects to Resources:

The project will require an environmental resource permit (ERP) from the South Florida Water Management District. The ERP applicant will be required to eliminate or reduce the proposed wetland resource impacts of the roadway extension project to the greatest extent practicable:

- Minimization should emphasize avoidance-oriented corridor alignments, wetland fill reductions via pile bridging and median width reductions within safety limits.
- Wetlands should not be displaced by the installation of stormwater conveyance and treatment swales; compensatory treatment in adjacent uplands is the preferred alternative. All stormwater treatment should be located in upland sites.
- After avoidance and minimization have been exhausted, mitigation must be proposed to offset the adverse impacts of the project to existing wetland functions and values. Significant attention is given to forested wetland systems, which are difficult to mitigate.

- The cumulative impacts of concurrent and future road improvement projects in the vicinity of the subject project should also be addressed.

Additional Comments (optional):

DEP ranks the Corridor 3 Alternative as # 2. Staff has expressed concerns regarding the fragmentation of wildlife habitat by the proposed roadway. The Department strongly recommends bridging ALL wetland crossings to minimize impacts to wetland connectivity/hydroperiod and wildlife corridor functions. Additionally, all stormwater should be conveyed to treatment sites located in upland areas.

Wildlife and Habitat

Coordinator Summary

4 Summary Degree of Effect

Wildlife and Habitat Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Both the FFWCC and USFWS indicated that several state and federally listed species may occur within the project area. Although no listed species occurrences are reported within the 500-foot buffer for this alternative, there is a high likelihood of occurrence of listed wading birds and wood storks because of the large area of wetlands present along this alignment. This alternative is also adjacent to publicly owned conservation lands. In addition, the 500-foot buffer for this alternative contains pineland that requires prescribed burning for habitat management. For these reasons, the summary degree of effect assigned to Wildlife and Habitat is substantial.

ETAT Review by Scott Sanders, FL Fish and Wildlife Conservation Commission (08/04/2006)

Wildlife and Habitat Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

The Habitat Conservation Scientific Services Section of the Florida Fish and Wildlife Conservation Commission (FWC) has coordinated an agency review of ETDM #8127 in Palm Beach County, and provides the following comments related to potential impacts to fish and wildlife resources for this Programming Phase project.

The proposed project involves the evaluation of the need to extend SR 7 from SR 704 (Okeechobee Boulevard) to Northlake Boulevard in Palm Beach County. Four corridors and a No-Build option have been identified for the project.

Corridor 3 would begin at the intersection of Okeechobee Boulevard and SR 7, follow the County's extension of Persimmon Boulevard, and continue north parallel to 110th Avenue. Near 60th Street, the alignment turns east, parallel to the M Canal, and then turns north to tie in with FDOT's existing Right-of-way (ROW). The alignment crosses the M canal, and continues north on the east side of the Ibis Golf and Country Club, and terminates at Northlake Boulevard.

This project was reviewed under the Advanced Notification process through the Florida State Clearinghouse at the Florida Department of Environmental Protection under SAI FL200506231187C (letter dated August 10, 2005, attached), and SAI# 9811160726C (letter dated December 2, 1998, attached). These FWC letters provide a detailed overview of project resources, including listed wildlife and plant species, potential impacts, and a course of action to reduce these impacts. We have reviewed these letters, and our previous comments remain applicable to the currently proposed project.

A GIS analysis of fish and wildlife and habitat resources was conducted using the Environmental Screening Tool (EST), and those results indicate that very similar upland and wetlands habitat types are present along all four corridors. Uplands within 500 feet of the proposed Corridor 3 include mixed pine-hardwood forest, pinelands, upland hardwood hammock, and dry prairie. Wetlands along this corridor include cypress swamp, cypress/pine/cabbage palm, freshwater marsh and wet prairie, hardwood swamp, mixed wetlands forests, open water, sawgrass marsh, and shrub swamp. Approximately 35.8 percent of the land within 500 feet of the corridor is in high and low impact urban land uses.

An all-inclusive accounting of the species listed by FWC which may occur in and adjacent to the project area include the eastern indigo snake (Threatened [T]), Florida pine snake (Species of Special Concern [SSC]), gopher tortoise (SSC), Shermans fox squirrel (SSC), Florida mouse (SSC), little blue heron (SSC), tricolored heron (SSC), white ibis (SSC), wood stork (E), snail kite (E), bald eagle (T), crested caracara (T), southeastern kestrel (T), limpkin (SSC), Florida sandhill crane (T), Florida burrowing owl (SSC), and

red-cockaded woodpecker (SSC). The presence or absence of some of these species within the project area is highly dependent on habitat type, plant successional stage, habitat quality, and site drainage conditions.

Habitat quality within 500 feet of the Right-of-way (ROW) for Corridor was evaluated using natural resource data layers within the EST. FWCs Biodiversity Hotspots data layer shows that 41.6 percent of the area is capable of supporting three to four, and five to six focal species. According to FWCs Integrated Wildlife Habitat Ranking System map, a total of 60.1 percent of this zone along the corridor has been assigned a score of from 6 to 8 (Scale 1 = Low, 10 = High), which ranks as good to excellent quality. According to the FWCs Priority Wetlands Map for wetlands dependent listed species, 43.7 percent of the habitat along the proposed roadway zone is ranked as capable of supporting 1 to 3 focal species in uplands, and 4 to 6 focal species in wetlands. Within this zone along the corridor, public and managed lands include the Loxahatchee Slough Natural Area, Grassy Waters Preserve, and the Pond Cypress Natural Area. Strategic Habitat Conservation Areas for the limpkin and wading birds have also been designated within 44.7 percent of this zone. Corridor 3 has the highest acreage of native upland habitat of the four corridors, and ranks number 1 in terms of the percentage of land area along the proposed ROW within the above five resource evaluation categories.

Comments on Effects to Resources:

Direct impacts to fish and wildlife from this project corridor would be substantial due to the significant amount of quality wetlands and uplands found along the corridor. Impacts could include habitat loss from roadway and Drainage Retention Area (DRA) construction, which would adversely affect a number of listed wildlife species. Due to the close proximity of three public land tracts, this corridor will potentially have substantial direct impacts on public lands.

Additional Comments (optional):

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we recommend the selection of Corridor 1, which will have less impact on natural resources.

We recommend the following measures be considered during the Project Development and Environment (PD&E) Study to avoid, minimize, and mitigate project impacts to listed species and habitat:

1. A vegetative cover map and accounting by acreage for each plant community type should be made for the affected project area. Compensatory mitigation for all upland and wetlands habitat loss should be required. If wetlands are mitigated under the provisions of Chapter 373.4137 F.S., the proposed mitigation sites should be located within the immediate or same regional area, functionally equivalent, equal to or of higher functional value, and as or more productive as the wetlands impacted by the project.
2. Surveys for listed species should be performed within and adjacent to the ROW and proposed sites for DRAs during the PD&E Study. The methodology for these surveys should be coordinated with FWC, and follow appropriate survey techniques or guidelines to determine presence, absence or probability of occurrence of various species, and to assess habitat quality. These study methods should be designed considering the potential listed species discussed above.
3. Based on the survey results, a plan should also be developed to address direct, secondary, and cumulative impacts of the project on wildlife and habitat resources, including listed species. Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate and supported by our agency.
4. The PD&E Study should also include an investigation of the design, cost, location, and construction

techniques for longer bridges over canals, sloughs and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.

5. Habitat impacts in both uplands and wetlands may be avoided where possible by interchangeably designing the road expansion along those areas where less habitat resources occur. In addition, using the median and roadside swales for treating roadside runoff would reduce the need for some off-site DRAs, and assist in reducing habitat loss.

6. Construction equipment staging areas; storage of oils, greases, and fuel; fill and roadbed material; and vehicle maintenance activities should be sited in previously disturbed areas far removed from streams, wetlands, or surface water bodies. Staging areas, along with borrow areas, should also be surveyed for listed species.

We appreciate the opportunity to provide input on highway design and the conservation of fish and wildlife resources. Please contact Steve Lau in our Vero Beach Office at (772) 778-5094 for further coordination on this project.

Identified Resources and Level of Importance:

Federally Listed Species and Fish and Wildlife Habitat

Comments on Effects to Resources:

Service Comments, Federally Listed Species: The Service has reviewed our Geographic Information Systems (GIS) database for recorded locations of federally listed threatened and endangered species on or adjacent to the project study area. The GIS database is a compilation of data received from several sources.

Wood Stork

The project corridor is located in the Core Foraging Areas (within 18.6 miles) of three active nesting colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA due to an action could result in the loss of foraging habitat for the wood stork. To minimize adverse effects to the wood stork, we recommend that any lost foraging habitat resulting from the project be replaced within the CFA of the affected nesting colony. Moreover, wetlands provided as mitigation should adequately replace the wetland functions lost as a result of the action. The Service does not consider the preservation of wetlands, by itself, as adequate compensation for impacts to wood stork

foraging habitat, because the habitat lost is not replaced. Accordingly, any wetland mitigation plan proposed should include a restoration, enhancement, or creation component. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a Service Approved mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Service believes that the following federally listed species have the potential to occur in or near the project site: wood stork, Everglade snail kite (*Rostrhamus sociabilis plumbeus*) and eastern indigo snake (*Drymarchon corais couperi*), as well as the federally protected plants listed at the link for Palm Beach County at our web site ([http://www.fws.gov/verobeach/Species_lists/PDF-lists/Palm Beach County.pdf](http://www.fws.gov/verobeach/Species_lists/PDF-lists/Palm%20Beach%20County.pdf)). Accordingly, the Service recommends that the Florida Department of Transportation (FDOT) prepare a Biological Assessment for the project (as required by 50 CFR 402.12) during the FDOTs Project Development and Environment process.

Service Comments, Fish and Wildlife Resources, Wetlands, and Special Designations:

Corridor 3 would follow Palm Beach Countys Persimmon Boulevard Extension and proceed east at the M-Canal for about 0.75 miles. The Corridor would then head northward for about 3 miles along the FDOT alignment to Northlake Avenue. The Service notes that Corridor 3 would directly impact uplands and wetlands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the Persimmon Boulevard Extension and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beachs Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

The northern segment of Corridor 3 borders the City of Palm Beachs Water Catchment Area. The Service believes that Corridor 3 will result in the direct loss of moderate quality habitat within the this section of the FDOT right-of-way. The Service also believes that Corridor 3 will result in significant adverse indirect effects to Fish and Wildlife in the City of West Palm Beachs Water Catchment Area. These effects would consist of disturbance from vehicle noise and vehicle and roadway lights.

Based on the impacts of to fish and wildlife habitat, wetlands, and public conservation lands, we cannot support Corridor 3 as the preferred alternative for the project. We recommend that the FDOT adopt Corridor 1 as the preferred alternative for the project.

Recreation Areas

Coordinator Summary

4 Summary Degree of Effect

Recreation Areas Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The GIS Analysis and comments from FDEP indicate that three designated public conservation lands are located within the vicinity of this alignment. As indicated by the Florida Natural Areas Inventory, these lands contain significant natural communities and numerous element occurrences of listed species. These lands are also important in terms of natural function such as flood control, filtering storm water runoff, aquifer recharge, etc. The potential impact of this alignment to these lands is determined to be substantial as it will cause wildlife habitat fragmentation. The final design for this alignment will avoid or minimize impacts to these lands, including any proposed acquisition sites in the project area, to the greatest extent practicable, and appropriate mitigation will be provided for unavoidable impacts. In addition, a biological assessment/evaluation (BA/BE) will be completed as part of the project development phase to capture any primary and indirect effects to the public lands and any proposed acquisition sites in the project area.

ETAT Reviews for Recreation Areas

4 ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Recreation Areas Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The following public conservation lands are located in the vicinity of this project: the Grassy Waters Preserve, Loxahatchee Slough Natural Area and Pond Cypress Natural Area.

Comments on Effects to Resources:

These lands contain significant natural communities and numerous element occurrences of listed species, as indicated by the Florida Natural Areas Inventory. The Department is interested in preserving the area's natural communities, wildlife corridor functions, natural flood control, stormwater runoff filtering capabilities, aquifer recharge potential, contributions to regional spring complexes, and recreational trail opportunities. Therefore, future environmental documentation should include an evaluation of the primary, secondary, and cumulative impacts of the proposed roadway widening construction on the above public lands and any proposed acquisition sites.

Additional Comments (optional):

Staff has expressed concerns regarding the fragmentation of wildlife habitat by the proposed roadway. The Department strongly recommends bridging ALL wetland crossings to minimize impacts to wetland connectivity/hydroperiod and wildlife corridor functions.

Land Use

Coordinator Summary

3

Summary Degree of Effect

Land Use Summary Degree of Effect: Moderate

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

While comments from FDCA and the Palm Beach County MPO indicate that this alignment will have less impacts on wetlands, the floodplain, and recreation/open space of the community; FHWA indicates that this alignment will cause significant secondary and cumulative impacts to the natural environment. In addition, this alignment is not addressed within the county's comprehensive plan. Based on these reasons, the summary degree of effect assigned to Land Use for this alignment is moderate. The final design for this alignment will

avoid or minimize land use impacts to the greatest extent practicable, and appropriate mitigation will be provided for unavoidable impacts. FDOT will also coordinate with the local government to ensure the project is consistent with the county's comprehensive plan.

ETAT Reviews for Land Use

3 ETAT Review by Gary Donaldson, FL Department of Community Affairs (08/08/2006)

Land Use Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The Department of Community Affairs (DCA) has reviewed the referenced project and, based on current information, this project (Alternatives 1 and 2) are not addressed within the local governments comprehensive plan. However, Alternative 4 is consistent with the Palm Beach County Future Transportation Map.

The Department is supportive of Alternative 3 as the preferred alignment because adverse environmental impacts to Grassy Waters Preserve and Pond Cypress Natural Area are minimized. Additionally, the proposed alignment is consistent with the recently approved Notice of Proposed Change (NOPC) for the Fox Property Development of Regional Impact (DRI). However, this alternative has not been identified in the local government comprehensive plan. Therefore, if Alternative 3 is selected as the preferred alignment, as per DCA preference, the project should not be advanced into the Department of Transportation's Five Year Work Program until the comprehensive plan is amended to reflect the proposed roadway modification.

Staff will make a determination of the consistency of the proposed roadway with the respective comprehensive plan when the comprehensive plan is amended to include the selected roadway alternative on an adopted future transportation map and improvement five year schedule.

Comments on Effects to Resources:

see above

Coordinator Feedback: None

4

ETAT Review by Scott Sanders, FL Fish and Wildlife Conservation Commission (08/04/2006)

Secondary and Cumulative Effects Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

At-Risk Resource:Wildlife and Habitat

Comments on Effects:

Secondary and cumulative impacts would be substantial due to increased residential and commercial development along the highway due to improved access. The roadway extension will also result in increased roadkills for many species of mammals, amphibians and reptiles, and some wading bird species. The expanded roadway will create a more formidable barrier to wildlife movement, and also result in habitat fragmentation and isolation. Increased stormwater runoff from the expanded impervious roadway surface could degrade the water quality of existing wetlands and streams along the ROW in the project area. Since three public land tracts are located immediately adjacent to the corridor, this action will potentially have substantial secondary impacts on public lands.

Recommended Avoidance, Minimization, and Mitigation Measures:

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we recommend the selection of Corridor 1, which will have less impact on natural resources.

Recommended Actions to Improve At-Risk Resources:

Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate and supported by our agency.

The PD&E Study should also include an investigation of the design, cost, location, and construction techniques for longer bridges over canals, sloughs and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures

would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.

3 Summary Degree of Effect

Floodplains Summary Degree of Effect: Moderate

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The EST GIS Analysis shows the following acreage of FEMA FIRM floodzones within the project's 500-foot buffer. (A 500-foot buffer was used due to the proposed new 6-lane divided alignment):

Zone A (378 acres): an area inundated by 100-year flooding for which no base elevations have been determined. Zone AO (66 acres): an area inundated by 100-year flooding for which average depths have been determined. Zone X500 (430 acres): an area inundated by 100-year flooding with average depths of less than 1 foot or with drainage areas less than one square mile.

Based on these results, 100 percent of the 500-foot buffer for each of the four alternative corridors occurs within a designated floodzone. A Location Hydraulics Report will be prepared for the project and the project will be designed to minimize floodplain impacts and compensate for potential floodplain encroachments. For these reasons, the summary degree of effect assigned to Floodplains is moderate.

Public Conservation Lands

Comments on Effects to Resources:

Corridor 4 begins at the intersection of Okeechobee Boulevard and proceeds northward along the FDOT right-of-way for approximately 4 miles to Northlake Boulevard. The Service notes that Corridor 4 would indirectly impact uplands and wetlands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the Persimmon Boulevard Extension and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beachs Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

Corridor 4 will result in the direct loss of fish and wildlife habitat and significantly fragment existing habitat in the Pond Cypress Natural Area, Section 1, and the City of West Palm Beachs Water Catchment Area. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat.

Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). We believe that Corridor 4 would also result in significant additional habitat loss and fragmentation in the Pond Cypress Natural Area and Section 1 due to the fact that Persimmon Boulevard and 60th Street North would likely be extended by Palm Beach County to tie into Corridor 4.

The northern segment of Corridor 4 borders the City of West Palm Beachs Water Catchment Area. The Service notes that Corridor 4 will result in the direct loss of moderate quality habitat within this section of the FDOT right-of-way. However, the Service believes that adoption of Corridor 4 will result in significant adverse indirect effects to Fish and Wildlife in the City of West Palm Beachs Water Catchment Area. These effects would consist of disturbance from vehicle noise and vehicle and roadway lights.

The Service was involved in the review of the Palm Beach Countys Persimmon Boulevard Extension project (also known as the Acreage Reliever Road). We worked with the County, and the U.S. Army Corps of Engineers (Corps) to develop an alignment that would minimize fragmentation of fish and wildlife habitat by locating the corridor as far to the west as possible. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). Our planning effort resulted in the adoption by Palm Beach County of the Persimmon Boulevard Extension corridor as illustrated in Figures 1-4 provided in the Project Description. It was our understanding that the extension of State Road 7 to Northlake Boulevard would consist of extending the Persimmon Boulevard corridor as illustrated in Alternatives 1 or 3. Accordingly, we were surprised to now see Corridors 2 and 4 proposed as alternatives for the project. Based on information from Palm Beach Countys consultant, it was the Services understanding that the portion of the FDOT right-of-way that is adjacent to the Section 1 mitigation parcel was included as mitigation for the Persimmon Boulevard Extension Project. The inclusion of this portion of the right-of-way was the basis for the Services concurrence letter to the Corps on the Persimmon Boulevard Extension project (see Attachments 1 and 2 in the Additional Comments Section). Without the inclusion of the FDOT right-of-way as part of the mitigation plan, the Service would have not provided a concurrence letter to the Corps at that time.

Based on the impacts of to fish and wildlife habitat, wetlands, and public conservation lands, we cannot support Corridor 4 as the preferred alternative for the project. We recommend that the FDOT adopt Corridor 1 as the preferred alternative for the project.

Subject FDOT ROW

John:

Sorry for any confusion. The FDOT ROW has always been intended to be released to Palm Beach County

as we discussed in the field. My e-mail on July 25 was not meant to confuse you. Deeded Conservation easement contains 544 acres=/. The FDOT ROW -- 80.6 acres (24-25 acres lie in Section 1 and the balance in Sections 12 & 13) will be incorporated into the Pond Cypress Preserve .The Corps draft SOF states this ROW is forthcoming. I spoke with Brandon yesterday and he told me we have enough mitigation. I tried to get a conference call to you not realizing your office was holding an all day staff meeting. Let me know if I can do anything to clear up any miscommunication I am responsible for, Thanks for calling me this morning at my office. I have been in the field and the best way to reach me is my cell at 561 -662-8849.

Regards,
Jim

Attachment 2. Letter from Service to Corps dated December 13, 2005, on the Acreage Reliever Road project proposed by Palm Beach County.

December 13, 2005

Lawrence C. Evans

US. Army Corps of Engineers

Palm Beach Gardens Regulatory Office

4400 PGA Boulevard, Suite 500

Palm Beach Gardens, Florida 3341 0

Attention: Brandon Howard

Service Log No.: 4-1-05-1 -9856

Corps Application No.: SAJ-2002-8273 (IP-KBH)

Date Received: August 14,2005

Project : Acreage Reliever Road

Applicant: Palm Beach County

County:Palm Beach County

Dear Mrs. Evans:

The Fish and Wildlife Service (Service) has reviewed your Public Notice and other information submitted by the U.S. Army Corps of Engineers (Corps) for the application referenced above.

This letter is submitted in accordance with section 7 of the Endangered Species Act of 1973, as amended (87 Stat. 884; 16 U.S.C. 1531 et seq.) and the provisions of the Fish and Wildlife Coordination Act of 1958, as amended (48 Stat. 401 ; 16 U.S.C. 661 et seq.).

PROJECT DESCRIPTION

The applicant proposes to construct a new four-lane roadway, known as the "Acreage Reliever Road," from Okeechobee Boulevard to 60th Street. The purpose of the project is to improve traffic flow in the area. The project will impact a total of 106 acres of wetlands. Wetlands at the project site consist of hydric pine (*Pinus elliotii*) flatwoods, wet prairie, and cypress (*Taxodium distichum*) wetlands. Some of the wetlands in the project site have been impacted by melaleuca (*Melaleuca quinquenervia*). As compensation for impacts to wetlands, the applicant had proposed to preserve and enhance 624.6 acres of high-quality wetlands and uplands within Sections 1, 12, 13, and 24, Township 43 South, Range 41 East, and to preserve and enhance 33.3 acres of uplands and wetlands west of the project corridor from 40th Street to 60th Street. Enhancement activities will consist of removal of exotic vegetation. The entire mitigation area will be added to Palm Beach County's Pond Cypress Natural Area. The project is located in Sections 1, 12, 13, 14, and 24, Township 43 South, Range 41 East, Palm Beach County, Florida. Lawrence C. Evans

THREATENED AND ENDANGERED SPECIES

Page 2

Wood stork

The project site is located within the core foraging areas (CFA) (i.e., within 18.6 miles) of four active breeding colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA may reduce foraging opportunities for wood storks. To minimize adverse effects to the wood stork, the Service's Draft Supplemental Habitat Management Guidelines for the Wood Stork in the South Florida Ecological Services Consultation Area (Service 2002) (Guidelines) recommends that the applicant replace wetlands lost due to the action. The compensation plan should include a temporal lag factor, if necessary, to ensure that wetlands provided as compensation adequately replace the wetland functions lost due to the project. Moreover, wetlands offered as compensation should be of the same hydroperiod, and located within the CFA of the affected wood stork colony. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a "Service Approved" mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Corps has determined the project "may affect, but is not likely to adversely affect" the wood stork. In our letter to the Corps, dated December 10, 2005, the Service noted information provided to the Service by the applicant's consultant indicated the wetlands mitigation proposed for the project had been reduced from 624.6 to 544.0 acres. A total of 80.6 acres of land (currently owned by the Florida Department of Transportation) located along the east side of the mitigation parcel had been removed from the mitigation proposal. The Service stated: (1) the compensation was not adequate to offset the loss of foraging habitat to the wood stork, (2) we could not provide concurrence for the Corps' determination, and (3) we recommended the applicant provide an additional 80.6 acres of mitigation in order to fulfill the original mitigation proposal. Based on recent discussions with the applicant's consultant and the Corps, we now understand this information was incorrect and the parcel is still included in the mitigation proposal. The Corps will require the applicant to preserve the 80.6-acre parcel within 1 year of issuance of the permit, and this will be included as a condition of the permit. Based on this new information, the Service believes the wetlands mitigation proposal is now adequate to compensate for the loss of wood stork foraging habitat, and we concur with the Corps' determination for the wood stork.

FISH AND WILDLIFE RESOURCES

The project will result in impacts to 106 acres of wetlands. The applicant proposes to mitigate the loss of wetlands by preserving and enhancing 624.6 acres of high-quality wetlands and uplands near the project site. The Service believes the proposed mitigation is adequate to compensate for the loss of wetlands resulting from the project.

Water Quality and Quantity

Coordinator Summary

4 Summary Degree of Effect

Water Quality and Quantity Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Because of the concerns stated by FDEP, notably the presence of the City of West Palm Beach Water Catchment Area immediately adjacent to the project, the summary degree of effect assigned to Water Quality and Quantity is substantial.

ETAT Reviews for Water Quality and Quantity

4 ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Water Quality and Quantity Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Stormwater runoff from the road surface may alter adjacent wetlands and surface waters through increased pollutant loading. Natural resource impacts within and adjacent to the proposed road right-of-way will likely include alteration of the existing surface water hydrology and natural drainage patterns, and reduction in flood attenuation capacity of area creeks, ditches, and sloughs as a result of increased impervious surface within the watershed. Every effort should be made to maximize the treatment of stormwater runoff from the proposed road project to prevent ground and surface water contamination. Stormwater treatment should be designed to maintain the natural pre-development hydroperiod and water quality, as well as to protect the natural functions of adjacent wetlands.

Comments on Effects to Resources:

We recommend that the study include an evaluation of existing stormwater treatment adequacy and details on the future stormwater treatment facilities. Retro-fitting of stormwater conveyance systems would help reduce impacts to water quality. Increased stormwater runoff carrying oils, greases, metals, sediment, and other pollutants from the increased impervious surface would be of significant concern.

Additional Comments (optional):

The Water Catchment Area for the City of West Palm Beach is immediately adjacent to the project. All activities must be designed to prevent stormwater pollutant contamination of the City's water supply. DEP recommends that the FDOT work to include the City on all decisions affecting this critical area.

Wetlands

Coordinator Summary

Summary Degree of Effect

Wetlands Summary Degree of Effect: Dispute Resolution

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

The following acreage of wetlands and open water habitats are reported by the ETDM GIS Analysis within the 500-foot buffer for each alternative:

National Wetlands Inventory database - 540 acres; Wetlands 2000 database - 528.3 acres; 2003 FFWCC Habitat and Landcover Grid database - 484.8 acres.

The proposed project is a 6-lane divided highway and would occupy much of the 500-foot buffer. Because of the concerns expressed by the agencies, the large area of wetlands occurring within the 500-foot buffer, and as a result of the Dispute Resolution process, Alternative 4 has been dropped as an alternative.

ETAT Reviews for Wetlands

ETAT Review by Alisa Zarbo, US Army Corps of Engineers (08/22/2006)

Wetlands Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Wetlands: This area was evaluated and considered in the permitting of the Acreage Reliever Road and has an extremely high level of importance to the Corps. Wildlife corridors were incorporated into the alignment of the Acreage Reliever Road. The Corps would try to keep the same continuity of the corridors when permitting this extension.

Comments on Effects to Resources:

If the roadway was constructed through corridor 4, it would fragment an extremely sensitive greenway and wildlife corridor that exists between the PCNA, the WCA and Section 1. The alignment would isolate the PCNA and the WCA to the extent that reptiles, amphibians and small and large mammals could not easily access the adjacent natural areas. Large natural areas are necessary for certain wildlife to carry out life functions such as feeding and nesting. Smaller isolated areas may accommodate only a few individuals with modest home range requirements. Small mammals and other forest dwelling wildlife have shown an aversion to using areas with less vegetative cover. This would be the case with a four-lane roadway that has a shoulder and median. Although some animals have an aversion to roadways, many attempt to cross and result in collisions that impact both wildlife and humans. During 1990, 431 vehicle collisions with animals (wild and domestic) were serious enough to be reported to the Florida Department of Highway Safety and Motor Vehicles. These accidents resulted in 4 human fatalities and 380 injuries. The average estimated property damage for each accident was \$3,395. Corridor 4 could result in extensions, as shown in the Conceptual Analysis Matrix, to access the Acreage. These extensions further fragment the ecosystem and isolate Section 1. Placing the roadway down the Rangeline would put it adjacent to the WCA. The WCA is a Class I potable water supply for the City of West Palm Beach. The roadway run-off would pose serious threats to the City's drinking water supply. The alternative of using a bridge along the Rangeline would not be a feasible alternative due to it being adjacent to the WCA.

Up to 60th Street, Corridor 3 has been approved by the Corps. From 60th Street the roadway is shown going east along the M-Canal. This portion and the following north south portion of the roadway that ends at Northlake Boulevard would isolate the mitigation area for the Ibis Golf and Country Club. Requirements for the portion of the roadway adjacent to the mitigation area would include fencing on both sides of the roadway, culverts to maintain adequate hydrology, slower speed limits, wildlife crossing signs and culverts

for wildlife crossings or bridges. The wildlife crossings should be placed above the seasonal high water elevation of wetlands but adjacent to wetlands. Wildlife crossings should be placed just above the ecotone of the wetland. The median should also be devoid of vegetation that would give the illusion of a narrow roadway to wildlife. Wildlife is more adverse to crossing wider roadways. Median landscaping plants should not provide a food source for wildlife. This would entice wildlife to cross the roadway and go into the median for food resulting in road kill. This area is within the Loxahatchee River Watershed and to a limited extent the Lake Worth Lagoon.

Additional Comments (optional):

Mitigation efforts should be concentrated in the same watershed. Mitigation options could include widening of the M-Canal and planting a flow through marsh to improve water quality. Mitigation in the WCA may be appropriate for this project.

ETAT Review by Madelyn T Martinez, National Marine Fisheries Service (08/14/2006)

Wetlands Effect: None

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

NONE

Comments on Effects to Resources:

NONE

Additional Comments (optional):

Based on the project location and information provided on the ETDM website, NOAA's National Marine Fisheries Service (NOAA Fisheries) concludes the proposed work would not directly impact areas that support NOAA trust resources. We have no comments or recommendations to provide pursuant to the essential fish habitat (EFH) requirements of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) P.L. 104-297. Further consultation on this matter is not necessary unless future modifications are proposed and you believe that the proposed action may result in adverse impacts to EFH.

Coordinator Feedback:None

4

ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Wetlands Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

The National Wetlands Inventory GIS report indicates that there are 538.51 acres of palustrine and 1.50 acres of riverine wetlands within the 500-ft. project buffer zone. The Wetlands 2000 report indicates that there are 555.80, 25.15, 7.00, 17.87, 2,725.85, 537.77, 269.31, 25.98, 1,450.61, 8.07 and 519.28 acres of cypress, cypress domes, mixed cypress hardwoods, emergent aquatic vegetation, freshwater marsh, mixed shrubs, mixed wetland hardwoods, wet melaleuca, wet pinelands, wet prairies and mixed wetland forests, respectively, within the 5,280-ft. buffer of the project area.

Comments on Effects to Resources:

The project will require an environmental resource permit (ERP) from the South Florida Water Management District. The ERP applicant will be required to eliminate or reduce the proposed wetland resource impacts of the roadway extension project to the greatest extent practicable:

- Minimization should emphasize avoidance-oriented corridor alignments, wetland fill reductions via pile bridging and median width reductions within safety limits.
- Wetlands should not be displaced by the installation of stormwater conveyance and treatment swales; compensatory treatment in adjacent uplands is the preferred alternative. All stormwater treatment should be located in upland sites.
- After avoidance and minimization have been exhausted, mitigation must be proposed to offset the adverse impacts of the project to existing wetland functions and values. Significant attention is given to forested wetland systems, which are difficult to mitigate.
- The cumulative impacts of concurrent and future road improvement projects in the vicinity of the subject project should also be addressed.

Additional Comments (optional):

DEP ranks the Corridor 4 Alternative as # 3. Staff has expressed concerns regarding the extreme fragmentation of wildlife habitat by the proposed roadway. The Department strongly recommends bridging ALL wetland crossings to minimize impacts to wetland connectivity/hydroperiod and wildlife corridor functions. Additionally, all stormwater should be conveyed to treatment sites located in upland areas.

Comments on Effects to Resources:

Corridor 4 begins at the intersection of Okeechobee Boulevard and proceeds northward along the FDOT right-of-way for approximately 4 miles to Northlake Boulevard. The Service notes that Corridor 4 would indirectly impact uplands and wetlands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the Persimmon Boulevard Extension

and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beachs Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

Corridor 4 will result in the direct loss of fish and wildlife habitat and significantly fragment existing habitat in the Pond Cypress Natural Area, Section 1, and the City of West Palm Beachs Water Catchment Area. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). We believe that Corridor 4 would also result in significant additional habitat loss and fragmentation in the Pond Cypress Natural Area and Section 1 due to the fact that Persimmon Boulevard and 60th Street North would likely be extended by Palm Beach County to tie into Corridor 4.

The northern segment of Corridor 4 borders the City of West Palm Beachs Water Catchment Area. The Service notes that Corridor 4 will result in the direct loss of moderate quality habitat within the this section of the FDOT right-of-way. However, the Service believes that adoption of Corridor 4 will result in significant adverse indirect effects to Fish and Wildlife in the City of West Palm Beachs Water Catchment Area. These effects would consist of disturbance from vehicle noise and vehicle and roadway lights.

The Service was involved in the review of the Palm Beach Countys Persimmon Boulevard Extension project (also known as the Acreage Reliever Road). We worked with the County, and the U.S. Army Corps of Engineers (Corps) to develop an alignment that would minimize fragmentation of fish and wildlife habitat by locating the corridor as far to the west as possible. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). Our planning effort resulted in the adoption by Palm Beach County of the Persimmon Boulevard Extension corridor as illustrated in Figures 1-4 provided in the Project Description. It was our understanding that the extension of State Road 7 to Northlake Boulevard would consist of extending the Persimmon Boulevard corridor as illustrated in Alternatives 1 or 3. Accordingly, we were surprised to now see Coridors 2 and 4 proposed as alternatives for the project. Based on information from Palm Beach Countys consultant, it was the Services understanding that the portion of the FDOT right-of-way that is adjacent to the Section 1 mitigation parcel was included as mitigation for the Persimmon Boulevard Extension Project. The inclusion of this portion of the right-of-way was the basis for the Services concurrence letter to the Corps on the Persimmon Boulevard Extension project (see Attachments 1 and 2 in the Additional Comments section). Without the inclusion of the FDOT right-of-way as part of the mitigation plan, the Service would have not provided a concurrence letter to the Corps at that time.

Based on the impacts of to fish and wildlife habitat, wetlands, and public conservation lands, we cannot support Corridor 4 as the preferred alternative for the project. We recommend that the FDOT adopt Corridor 1 as the preferred alternative for the project.

Corps Application No.: SAJ-2002-8273 (IP-KBH)
Date Received: August 14,2005
Project : Acreage Reliever Road
Applicant: Palm Beach County
County:Palm Beach County

Dear Mrs. Evans:

The Fish and Wildlife Service (Service) has reviewed your Public Notice and other information submitted by the U.S. Army Corps of Engineers (Corps) for the application referenced above. This letter is submitted in accordance with section 7 of the Endangered Species Act of 1973, as amended (87 Stat. 884; 16 U.S.C. 1531 et seq.) and the provisions of the Fish and Wildlife Coordination Act of 1958, as amended (48 Stat. 401 ; 16 U.S.C. 661 et seq.).

PROJECT DESCRIPTION

The applicant proposes to construct a new four-lane roadway, known as the "Acreage Reliever Road," from Okeechobee Boulevard to 60th Street. The purpose of the project is to improve traffic flow in the area. The project will impact a total of 106 acres of wetlands. Wetlands at the project site consist of hydric pine (*Pinus elliottii*) flatwoods, wet prairie, and cypress (*Taxodium distichum*) wetlands. Some of the wetlands in the project site have been impacted by melaleuca (*Melaleuca quinquenervia*). As compensation for impacts to wetlands, the applicant had proposed to preserve and enhance 624.6 acres of high-quality wetlands and uplands within Sections 1, 12, 13, and 24, Township 43 South, Range 41 East, and to preserve and enhance 33.3 acres of uplands and wetlands west of the project corridor from 40th Street to 60th Street. Enhancement activities will consist of removal of exotic vegetation. The entire mitigation area will be added to Palm Beach County's Pond Cypress Natural Area. The project is located in Sections 1, 12, 13, 14, and 24, Township 43 South, Range 41 East, Palm Beach County, Florida.
Lawrence C. Evans

THREATENED AND ENDANGERED SPECIES

Page 2

Wood stork

The project site is located within the core foraging areas (CFA) (i.e., within 18.6 miles) of four active breeding colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA may reduce foraging opportunities for wood storks. To minimize adverse effects to the wood stork, the Service's Draft Supplemental Habitat Management Guidelines for the Wood Stork in the South Florida Ecological Services Consultation Area (Service 2002) (Guidelines) recommends that the applicant replace wetlands lost due to the action. The compensation plan should include a temporal lag factor, if necessary, to ensure that wetlands provided as compensation adequately replace the wetland functions lost due to the project. Moreover, wetlands offered as compensation should be of the same hydroperiod, and located within the CFA of the affected wood stork colony. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a "Service Approved" mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Corps has determined the project "may affect, but is not likely to adversely affect" the wood stork. In our letter to the Corps, dated December 10, 2005, the Service noted information provided to the Service by the applicant's consultant indicated the wetlands mitigation proposed for the project had been reduced from 624.6 to 544.0 acres. A total of 80.6 acres of land (currently owned by the Florida Department of Transportation) located along the east side of the mitigation parcel had been removed from the mitigation proposal. The Service stated: (1) the compensation was not adequate to offset the loss of foraging habitat to the wood stork, (2) we could not provide concurrence for the Corps' determination, and (3) we recommended the applicant provide an additional 80.6 acres of mitigation in order to fulfill the original mitigation proposal. Based on recent discussions with the applicant's consultant and the Corps, we now understand this information was incorrect and the parcel is still included in the mitigation proposal. The Corps will require the applicant to preserve the 80.6-acre parcel within 1 year of issuance of the permit, and this will be included as a condition of the permit. Based on this new information, the Service believes the wetlands mitigation proposal is now adequate to compensate for the loss of wood stork foraging habitat, and we concur with the Corps' determination for the wood stork.

FISH AND WILDLIFE RESOURCES

The project will result in impacts to 106 acres of wetlands. The applicant proposes to mitigate the loss of wetlands by preserving and enhancing 624.6 acres of high-quality wetlands and uplands near the project site. The Service believes the proposed mitigation is adequate to compensate for the loss of wetlands resulting from the project.

Wildlife and Habitat

Coordinator Summary

5 Summary Degree of Effect

Wildlife and Habitat Summary Degree of Effect: Dispute Resolution

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Both the FFWCC and USFWS indicated that several state and federally listed species may occur within the project area. Although no listed species occurrences are reported within the 500-foot buffer for this alternative, there is a high likelihood of occurrence of listed wading birds and wood storks because of the large area of wetlands present along this alignment. This alternative is also adjacent to publicly owned conservation lands. In addition, the 500-foot buffer for this alternative contains pineland that requires prescribed burning for habitat management. For these reasons, and as a result of the Dispute Resolution process, Alternative 4 has been dropped as an alternative.

4 ETAT Review by Scott Sanders, FL Fish and Wildlife Conservation Commission (08/04/2006)

Wildlife and Habitat Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The Habitat Conservation Scientific Services Section of the Florida Fish and Wildlife Conservation Commission (FWC) has coordinated an agency review of ETDM #8127 in Palm Beach County, and provides the following comments related to potential impacts to fish and wildlife resources for this Programming Phase project.

The proposed project involves an evaluation of need to extend SR 7 from SR 704 (Okeechobee Boulevard) to Northlake Boulevard in Palm Beach County. Four corridors and a No-Build option have been identified for the project.

Corridor 4 would begin at the intersection of Okeechobee Boulevard and SR 7, follow FDOTs existing Right-of-way, cross the M Canal, and terminate at Northlake Boulevard. This alignment is referred to as the Range Line alignment.

This project was reviewed under the Advanced Notification process through the Florida State Clearinghouse at the Florida Department of Environmental Protection under SAI FL200506231187C (letter dated August 10, 2005, attached), and SAI# 9811160726C (letter dated December 2, 1998, attached). These FWC letters provide a detailed overview of project resources, including listed wildlife and plant species, potential impacts, and a course of action to reduce these impacts. We have reviewed these letters, and our previous comments remain applicable to the currently proposed project.

A GIS analysis of fish and wildlife and habitat resources was conducted using the Environmental Screening Tool (EST), and those results indicate that very similar upland and wetland habitat types are present along all four corridors. Uplands within 500 feet of the proposed Corridor 4 include mixed pine-hardwood forest, pinelands, upland hardwood hammock, and dry prairie. Wetlands along this corridor include cypress swamp, cypress/pine/cabbage palm, freshwater marsh and wet prairie, hardwood swamp, mixed wetland forests, open water, sawgrass marsh, and shrub swamp. Approximately 16.3 percent of the land within 500 feet of the corridor is in high and low impact urban land uses.

An all-inclusive accounting of the species listed by FWC which may occur in and adjacent to the project area include the eastern indigo snake (Threatened [T]), Florida pine snake (Species of Special Concern [SSC]), gopher tortoise (SSC), Shermans fox squirrel (SSC), Florida mouse (SSC), little blue heron (SSC), tricolored heron (SSC), white ibis (SSC), wood stork (E), snail kite (E), bald eagle (T), crested caracara (T), southeastern kestrel (T), limpkin (SSC), Florida sandhill crane (T), Florida burrowing owl (SSC), and red-cockaded woodpecker (SSC). The presence or absence of some of these species within the project area is highly dependent on habitat type, plant successional stage, habitat quality, and site drainage conditions.

Habitat quality within 500 feet of the Right-of-way (ROW) for Corridor 4 was evaluated using natural resource data layers in the EST. FWCs Biodiversity Hotspots data layer shows that 46.3 percent of the area is capable of supporting three to four, and 5 to 6 focal species. According to FWCs Integrated Wildlife Habitat Ranking System map, a total of 63.5 percent of this zone along the corridor has been assigned a score of from 6 to 8 (Scale 1 = Low, 10 = High) which ranks as good to excellent quality. According to FWCs Priority Wetlands Map for wetlands dependent listed species, 38.7 percent of the habitat along the proposed roadway zone is ranked as capable of supporting 1 to 3 focal species in uplands, and 4 to 6 focal species in wetlands. Within this zone along the corridor, public and managed lands include the Loxahatchee Slough Natural Area, Grassy Waters Preserve, and the Pond Cypress Natural Area. A total of 31.6 percent of the zone along Corridor 4 has been designated by FWC as Strategic Habitat Conservation Areas for the limpkin, wading birds, and the short-tailed hawk. Corridor 4 has the highest acreage of native wetlands, and the second highest extent of native upland habitats of the four corridors.

Comments on Effects to Resources:

Direct impacts to fish and wildlife from this project corridor could be substantial due to the significant amount of quality wetlands and uplands found along the corridor. Impacts could include habitat loss from roadway and Drainage Retention Area (DRA) construction, which would adversely affect a number of

listed wildlife species. Due to the close proximity of three public land tracts, this corridor will potentially have substantial direct impacts on public lands.

Additional Comments (optional):

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we recommend the selection of Corridor 1, which will have less impact on natural resources.

We recommend the following measures be considered during the Project Development and Environment (PD&E) Study to avoid, minimize, and mitigate project impacts to listed species and habitat:

1. A vegetative cover map and accounting by acreage for each plant community type should be made for the affected project area. Compensatory mitigation for all upland and wetlands habitat loss should be required. If wetlands are mitigated under the provisions of Chapter 373.4137 F.S., the proposed mitigation sites should be located within the immediate or same regional area, functionally equivalent, equal to or of higher functional value, and as or more productive as the wetlands impacted by the project.
2. Surveys for listed species should be performed within and adjacent to the ROW and proposed sites for DRAs during the PD&E Study. The methodology for these surveys should be coordinated with FWC, and follow appropriate survey techniques or guidelines to determine presence, absence or probability of occurrence of various species, and to assess habitat quality. These study methods should be designed considering the potential listed species discussed above.
3. Based on the survey results, a plan should also be developed to address direct, secondary, and cumulative impacts of the project on wildlife and habitat resources, including listed species. Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate and supported by our agency.
4. The PD&E Study should also include an investigation of the design, cost, location, and construction techniques for longer bridges over canals, sloughs, and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.
5. Habitat impacts in both uplands and wetlands may be avoided where possible by interchangeably designing the road expansion along those areas where less habitat resources occur. In addition, using the median and roadside swales for treating roadside runoff would reduce the need for some off-site DRAs, and assist in reducing habitat loss.
6. Construction equipment staging areas; storage of oils, greases, and fuel; fill and roadbed material; and vehicle maintenance activities should be sited in previously disturbed areas far removed from streams, wetlands, or surface water bodies. Staging areas, along with borrow areas, should also be surveyed for listed species.

We appreciate the opportunity to provide input on highway design and the conservation of fish and wildlife resources. Please contact Steve Lau in our Vero Beach Office at (772) 778-5094 for further coordination on this project.

Wildlife and Habitat Effect: Dispute Resolution

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:

"Dispute Support" options were not available at the time of the review.

Identified Resources and Level of Importance:

Federally Listed Species and Fish and Wildlife Resources

Comments on Effects to Resources:

Service Comments, Federally Listed Species: The Service has reviewed our Geographic Information Systems (GIS) database for recorded locations of federally listed threatened and endangered species on or adjacent to the project study area. The GIS database is a compilation of data received from several sources.

Wood Stork

The project corridor is located in the Core Foraging Areas (within 18.6 miles) of three active nesting colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA due to an action could result in the loss of foraging habitat for the wood stork. To minimize adverse effects to the wood stork, we recommend that any lost foraging habitat resulting from the project be replaced within the CFA of the affected nesting colony. Moreover, wetlands provided as mitigation should adequately replace the wetland functions lost as a result of the action. The Service does not consider the preservation of wetlands, by itself, as adequate compensation for impacts to wood stork foraging habitat, because the habitat lost is not replaced. Accordingly, any wetland mitigation plan proposed should include a restoration, enhancement, or creation component. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a Service Approved mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Service believes that the following federally listed species have the potential to occur in or near the project site: wood stork, Everglade snail kite (*Rostrhamus sociabilis plumbeus*) and eastern indigo snake (*Drymarchon corais couperi*), as well as the federally protected plants listed at the link for Palm Beach County at our web site ([http://www.fws.gov/verobeach/ Species_lists/ PDF-lists/Palm Beach County.pdf](http://www.fws.gov/verobeach/Species_lists/PDF-lists/Palm%20Beach%20County.pdf)). Accordingly, the Service recommends that the Florida Department of Transportation (FDOT) prepare a Biological Assessment for the project (as required by 50 CFR 402.12) during the FDOTs Project Development and Environment process.

Service comments Fish and Wildlife Habitat, Wetlands, and Special Designations:

Corridor 4

Corridor 4 begins at the intersection of Okeechobee Boulevard and proceeds northward along the FDOT right-of-way for approximately 4 miles to Northlake Boulevard. The Service notes that Corridor 4 would indirectly impact uplands and wetlands currently protected for conservation purposes at Pond Cypress Natural Area. These lands include the parcel known as Section 1. Section 1 has been purchased by Palm Beach County as mitigation for impacts to wetlands resulting from the Persimmon Boulevard Extension

and will be added to the Pond Cypress Natural Area. The Pond Cypress Natural Area and Section 1 are contiguous with a large block (>10,000 acres) of protected native habitat located directly to the east in the City of West Palm Beachs Water Catchment Area (also known as Grassy Waters Preserve). Pond Cypress Natural Area, Section 1, and the Water Catchment Area currently provide important habitat to variety of species including wading birds, small mammals, reptiles, amphibians, and small fishes. Portions of the wetlands and uplands within the Pond Cypress Natural Area and Section 1 have been impacted by the exotic invasive tree melaleuca (*Melaleuca quinquenervia*). Moreover, some of the wetlands in Section 1 have been degraded by off-road vehicles. Although these areas have been impacted, the Service notes that they still largely consist of good quality habitat for fish and wildlife. Furthermore, we understand that Palm Beach County intends to develop a management plan for the entire Pond Cypress Natural Area that will result in the removal of melaleuca and prohibit off-road vehicle use. We expect that the management activities proposed will restore areas of degraded habitat and benefit fish and wildlife in the area.

Corridor 4 will result in the direct loss of fish and wildlife habitat and significantly fragment existing habitat in the Pond Cypress Natural Area, Section 1, and the City of West Palm Beachs Water Catchment Area. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). We believe that Corridor 4 would also result in significant additional habitat loss and fragmentation in the Pond Cypress Natural Area and Section 1 due to the fact that Persimmon Boulevard and 60th Street North would likely be extended by Palm Beach County to tie into Corridor 4.

The northern segment of Corridor 4 borders the City of West Palm Beachs Water Catchment Area. The Service notes that Corridor 4 will result in the direct loss of moderate quality habitat within the this section of the FDOT right-of-way. However, the Service believes that adoption of Corridor 4 will result in significant adverse indirect effects to Fish and Wildlife in the City of West Palm Beachs Water Catchment Area. These effects would consist of disturbance from vehicle noise and vehicle and roadway lights.

The Service was involved in the review of the Palm Beach Countys Persimmon Boulevard Extension project (also known as the Acreage Reliever Road). We worked with the County, and the U.S. Army Corps of Engineers (Corps) to develop an alignment that would minimize fragmentation of fish and wildlife habitat by locating the corridor as far to the west as possible. Fragmentation of habitat adversely affects wildlife by reducing the extent and connectivity of remaining habitats, and eliminating habitat for those species requiring large unbroken blocks of habitat. Fragmentation may also increase the likelihood of predation for some species, and over time can lead to the loss of genetic diversity, reduce population size and increase the likelihood of local species extinctions (Forman et al. 2003). Our planning effort resulted in the adoption by Palm Beach County of the Persimmon Boulevard Extension corridor as illustrated in Figures 1-4 provided in the Project Description. It was our understanding that the extension of State Road 7 to Northlake Boulevard would consist of extending the Persimmon Boulevard corridor as illustrated in Alternatives 1 or 3. Accordingly, we were surprised to now see Coridors 2 and 4 proposed as alternatives for the project. Based on information from Palm Beach Countys consultant, it was the Services understanding that the portion of the FDOT right-of-way that is adjacent to the Section 1 mitigation parcel was included as mitigation for the Persimmon Boulevard Extension Project. The inclusion of this portion of the right-of-way was the basis for the Services concurrence letter to the Corps on the Persimmon Boulevard Extension project (see Attachments 1 and 2 in Additional Comments). Without the inclusion of the FDOT right-of-way as part of the mitigation plan, the Service would have not provided a concurrence letter to the Corps at that time.

Based on the impacts of to fish and wildlife habitat, wetlands, and public conservation lands, we cannot support Corridor 4 as the preferred alternative for the project. We recommend that the FDOT adopt Corridor 1 as the preferred alternative for the project.

Subject FDOT ROW

John:

Sorry for any confusion. The FDOT ROW has always been intended to be released to Palm Beach County as we discussed in the field. My e-mail on July 25 was not meant to confuse you. Deeded Conservation easement contains 544 acres=/. The FDOT ROW -- 80.6 acres (24-25 acres lie in Section 1 and the balance in Sections 12 & 13) will be incorporated into the Pond Cypress Preserve. The Corps draft SOF states this ROW is forthcoming. I spoke with Brandon yesterday and he told me we have enough mitigation. I tried to get a conference call to you not realizing your office was holding an all day staff meeting. Let me know if I can do anything to clear up any miscommunication I am responsible for, Thanks for calling me this morning at my office. I have been in the field and the best way to reach me is my cell at 561 -662-8849.

Regards,
Jim

Attachment 2. Letter from Service to Corps dated December 13, 2005, on the Acreage Reliever Road project proposed by Palm Beach County.

December 13, 2005

Lawrence C. Evans

US. Army Corps of Engineers

Palm Beach Gardens Regulatory Office

Palm Beach Gardens, Florida 33410

Attention: Brandon Howard

Service Log No.: 4-1-05-1 -9856
Corps Application No.: SAJ-2002-8273 (IP-KBH)
Date Received: August 14, 2005
Project : Acreage Reliever Road
Applicant: Palm Beach County
County: Palm Beach County

Dear Mrs. Evans:

The Fish and Wildlife Service (Service) has reviewed your Public Notice and other information submitted by the U.S. Army Corps of Engineers (Corps) for the application referenced above. This letter is submitted in accordance with section 7 of the Endangered Species Act of 1973, as amended (87 Stat. 884; 16 U.S.C. 1531 et seq.) and the provisions of the Fish and Wildlife Coordination Act of 1958, as amended (48 Stat. 401 ; 16 U.S.C. 661 et seq.).

PROJECT DESCRIPTION

The applicant proposes to construct a new four-lane roadway, known as the "Acreage Reliever Road," from Okeechobee Boulevard to 60th Street. The purpose of the project is to improve traffic flow in the area. The project will impact a total of 106 acres of wetlands. Wetlands at the project site consist of hydric pine (*Pinus elliotii*) flatwoods, wet prairie, and cypress (*Taxodium distichum*) wetlands. Some of the wetlands in the project site have been impacted by melaleuca (*Melaleuca quinquenervia*). As compensation for impacts to wetlands, the applicant had proposed to preserve and enhance 624.6 acres of high-quality wetlands and uplands within Sections 1, 12, 13, and 24, Township 43 South, Range 41 East, and to preserve and enhance 33.3 acres of uplands and wetlands west of the project corridor from 40th Street to 60th Street. Enhancement activities will consist of removal of exotic vegetation. The entire mitigation area will be added to Palm Beach County's Pond Cypress Natural Area. The project is located in Sections 1, 12, 13, 14, and 24, Township 43 South, Range 41 East, Palm Beach County, Florida.
Lawrence C. Evans

THREATENED AND ENDANGERED SPECIES

Page 2

Wood stork

The project site is located within the core foraging areas (CFA) (i.e., within 18.6 miles) of four active breeding colonies of the endangered wood stork (*Mycteria americana*). The Service believes that the loss of wetlands within a CFA may reduce foraging opportunities for wood storks. To minimize adverse effects to the wood stork, the Service's Draft Supplemental Habitat Management Guidelines for the Wood Stork in the South Florida Ecological Services Consultation Area (Service 2002) (Guidelines) recommends that the applicant replace wetlands lost due to the action. The compensation plan should include a temporal lag factor, if necessary, to ensure that wetlands provided as compensation adequately replace the wetland functions lost due to the project. Moreover, wetlands offered as compensation should be of the same hydroperiod, and located within the CFA of the affected wood stork colony. In some cases, the Service accepts wetlands compensation located outside the CFA of the affected wood stork nesting colony. Specifically, wetland credits purchased from a "Service Approved" mitigation bank located outside of the CFA would be acceptable to the Service, provided that the impacted wetlands occur within the permitted service area of the bank.

The Corps has determined the project "may affect, but is not likely to adversely affect" the wood stork. In our letter to the Corps, dated December 10, 2005, the Service noted information

provided to the Service by the applicant's consultant indicated the wetlands mitigation proposed for the project had been reduced from 624.6 to 544.0 acres. A total of 80.6 acres of land (currently owned by the Florida Department of Transportation) located along the east side of the mitigation parcel had been removed from the mitigation proposal. The Service stated: (1) the compensation was not adequate to offset the loss of foraging habitat to the wood stork, (2) we could not provide concurrence for the Corps' determination, and (3) we recommended the applicant provide an additional 80.6 acres of mitigation in order to fulfill the original mitigation proposal. Based on recent discussions with the applicant's consultant and the Corps, we now understand this information was incorrect and the parcel is still included in the mitigation proposal. The Corps will require the applicant to preserve the 80.6-acre parcel within 1 year of issuance of the permit, and this will be included as a condition of the permit. Based on this new information, the Service believes the wetlands mitigation proposal is now adequate to compensate for the loss of wood stork foraging habitat, and we concur with the Corps' determination for the wood stork.

FISH AND WILDLIFE RESOURCES

The project will result in impacts to 106 acres of wetlands. The applicant proposes to mitigate the loss of wetlands by preserving and enhancing 624.6 acres of high-quality wetlands and uplands near the project site. The Service believes the proposed mitigation is adequate to compensate for the loss of wetlands resulting from the project.

Lawrence C. Evans Page 3

Thank you for allowing us to provide these comments and for your cooperation and effort in protecting federally listed species. If you have any questions regarding this project, please contact John Wrublik at 772-562-3909, extension 282.

Recreation Areas Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/25/2007)

Comments:

The GIS Analysis and comments from FDEP indicate that three designated public conservation lands are located within the vicinity of this alignment. As indicated by the Florida Natural Areas Inventory, these lands contain significant natural communities and numerous element occurrences of listed species. These lands are also important in terms of natural function such as flood control, filtering storm water runoff, aquifer recharge, etc. The potential impact of this alignment to these lands is determined to be substantial as it will cause wildlife habitat fragmentation.

ETAT Reviews for Recreation Areas**4** ETAT Review by Lauren P. Milligan, FL Department of Environmental Protection (08/11/2006)

Recreation Areas Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

The following public conservation lands are located in the vicinity of this project: the Grassy Waters Preserve, Loxahatchee Slough Natural Area and Pond Cypress Natural Area.

Comments on Effects to Resources:

These lands contain significant natural communities and numerous element occurrences of listed species, as indicated by the Florida Natural Areas Inventory. The Department is interested in preserving the area's natural communities, wildlife corridor functions, natural flood control, stormwater runoff filtering capabilities, aquifer recharge potential, contributions to regional spring complexes, and recreational trail opportunities. Therefore, future environmental documentation should include an evaluation of the primary, secondary, and cumulative impacts of the proposed roadway widening construction on the above public lands and any proposed acquisition sites.

Additional Comments (optional):

Staff has expressed concerns regarding the extreme fragmentation of wildlife habitat by the proposed roadway. The Department strongly recommends bridging ALL wetland crossings to minimize impacts to wetland connectivity/hydroperiod and wildlife corridor functions.

ETAT Reviews for Land Use

3 ETAT Review by Gary Donaldson, FL Department of Community Affairs (08/08/2006)

Land Use Effect: Moderate

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

The Department of Community Affairs (DCA) has reviewed the referenced project and, based on current information, this project (Alternatives 1 and 2) are not addressed within the local governments comprehensive plan. However, Alternative 4 is consistent with the Palm Beach County Future Transportation Map.

The Department is supportive of Alternative 3 as the preferred alignment because adverse environmental impacts to Grassy Waters Preserve and Pond Cypress Natural Area are minimized. Additionally, the proposed alignment is consistent with the recently approved Notice of Proposed Change (NOPC) for the Fox Property Development of Regional Impact (DRI). However, this alternative has not been identified in the local government comprehensive plan. Therefore, if Alternative 3 is selected as the preferred alignment, as per DCA preference, the project should not be advanced into the Department of Transportations Five Year Work Program until the comprehensive plan is amended to reflect the proposed roadway modification.

Staff will make a determination of the consistency of the proposed roadway with the respective comprehensive plan when the comprehensive plan is amended to include the selected roadway alternative on an adopted future transportation map and improvement five year schedule.

Comments on Effects to Resources:

see above

Coordinator Feedback:None

4 ETAT Review by Patricia Masterman, Palm Beach MPO (08/04/2006)

Land Use Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

Identified Resources and Level of Importance:

A substantial impact may be realized by the WPB Water Catchment Area and the wetland and floodplain encroachment as the alignment runs six miles into environmentally sensitive areas.

Comments on Effects to Resources:

This alignment may not be compatible with land use plans.

Additional Comments (optional):

Only 2 acres of right-of-way would need to be acquired.

CLC Commitments and Recommendations:

No further comment.

Coordinator Feedback:None

- No review submitted from the Federal Highway Administration

Mobility

Coordinator Summary

1 Summary Degree of Effect

Mobility Summary Degree of Effect: Enhanced

Reviewed By:

FDOT District 4 (4/24/2007)

Comments:

Comments from the Palm Beach County MPO indicate that this alignment will enhance bicycle and pedestrian mobility, which, in turn, will improve connectivity between communities. Based on these reasons, the summary degree of effect assigned to Mobility for this alignment is enhanced.

ETAT Reviews for Mobility

1 ETAT Review by Patricia Masterman, Palm Beach MPO (08/04/2006)

Mobility Effect: Enhanced

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

Bicycle/pedestrian mobility will be enhanced.

Comments on Effects to Resources:

Bicycle and pedestrian lanes along the corridor would create connectivity between northern and southern communities.

Additional Comments (optional):

None.

CLC Commitments and Recommendations:

None

Coordinator Feedback: None

- No review submitted from the Federal Highway Administration

Comments:

This alignment will have little or no impact on minority or low income populations. In addition, no residential

properties will be impacted by this alignment. Based on these reasons, the summary degree of effect assigned to Social for this alignment is none.

ETAT Reviews for Social

0 ETAT Review by Patricia Masterman, Palm Beach MPO (08/04/2006)

Social Effect: None

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

Identified Resources and Level of Importance:

This alignment will have little or no impact on minority or low income populations.

Comments on Effects to Resources:

Since this alignment is located in the middle of the wetlands there is no impact on established residential neighborhoods.

Additional Comments (optional):

There may be limited enhancement on quality of life with this alignment as far as emergency services for communities between Okeechobee and Northlake Boulevards, however the residential communities to the west of the alignment will most likely feel little change in services.

CLC Commitments and Recommendations:

No further comment.

ETAT Reviews: Secondary and Cumulative

Secondary and Cumulative Effects

Coordinator Summary

4 Summary Degree of Effect

Secondary and Cumulative Effects Summary Degree of Effect: Substantial

Reviewed By:

FDOT District 4 (4/25/2007)

Comments:

Comments from FFWCC and FHWA indicate that this alignment, in particular, is anticipated to have substantial

secondary and cumulative effects on the environment and community as it may serve as a springboard for future roadway extensions to the north, as well as east/west connections. Therefore, the summary degree of effect assigned to Secondary and Cumulative Impacts for this alignment is substantial.

ETAT Reviews for Secondary and Cumulative Effects

4 ETAT Review by Nahir Detizio, Federal Highway Administration (08/10/2006)

Secondary and Cumulative Effects Effect: Substantial

Coordination Document: *The "Coordination Document" option was not available at the time of the review.*

Dispute Information: N/A

At-Risk Resource: Wetlands

Comments on Effects:

The eastern alignments have substantial secondary impacts primarily related to the water/wetlands and habitat resources. Alternative 4 may also have substantial secondary impacts to resources north of North Lake Boulevard if the proposed alternative were to serve as the springboard for later roadway extensions to the north, and to facilitate additional development in that area than would otherwise occur. Similarly, Alternative 4 may have additional substantial secondary and cumulative impacts to the wetland/water and habitat resources if east/west connections are made to the proposed route in order to better serve the residential developments to the west. The environmental document should assess these secondary impacts of the alternatives, as well as cumulative impacts to the areas wetland/water and habitat resources from all area development that is reasonably foreseeable to occur.

Recommended Avoidance, Minimization, and Mitigation Measures:

None found.

Recommended Actions to Improve At-Risk Resources:

None found.

At-Risk Resource: Wildlife and Habitat

Coordinator Feedback:None

4 ETAT Review by Scott Sanders, FL Fish and Wildlife Conservation Commission (08/04/2006)

Secondary and Cumulative Effects Effect: Substantial

Coordination Document:*The "Coordination Document" option was not available at the time of the review.*

Dispute Information:N/A

At-Risk Resource:Wildlife and Habitat

Comments on Effects:

Secondary and cumulative impacts would be substantial due to increased residential and commercial development along the highway due to improved access. The roadway extension will also result in increased roadkills for many species of mammals, amphibians and reptiles, and some wading bird species. The expanded roadway will create a more formidable barrier to wildlife movement, and also result in habitat fragmentation and isolation. Increased stormwater runoff from the expanded impervious roadway surface could degrade the water quality of existing wetlands and streams along the ROW in the project area. Since three public land tracts are located immediately adjacent to the corridor, this action will potentially have substantial secondary impacts on public lands.

Recommended Avoidance, Minimization, and Mitigation Measures:

In order to reduce the impacts to fish and wildlife resources and important habitat, we continue to recommend that the existing road network be improved in order to resolve the current transportation need. If through further study, this proves not to be feasible, we recommend the selection of Corridor 1, which will have less impact on natural resources.

Recommended Actions to Improve At-Risk Resources:

Avoidance, minimization, and mitigation measures, including compensatory replacement for both upland and wetlands habitat loss, should also be addressed. Land acquisition and restoration of appropriate tracts adjacent to existing public lands, or tracts placed under conservation easement located adjacent to large areas of jurisdictional wetlands that currently serve as regional core habitat areas, would be biologically appropriate and supported by our agency.

The PD&E Study should also include an investigation of the design, cost, location, and construction techniques for longer bridges over canals, sloughs, and their floodplains, and wetlands, which would improve hydrological and floodplain functioning, and minimize wetlands fill. These improved structures would also reduce roadkills and provide improved habitat connectivity for wildlife species such as whitetail deer, bobcat, river otter, and other upland, transitional, and aquatic species that use wetlands riparian systems within the project area.

FDOT ETDM Coordinator	Richard Young (FDOT District 4)	ACCEPTED	4/27/2007
Comments	No comments were found.		
	Name	Review Status	Date
Lead Agency ETAT Member	Cathy Kendall (Federal Highway Administration)	ACCEPTED	4/27/2007
Comments	FHWA accepts a Class of Action for Alternative 3 to proceed as an Environmental Assessment. This decision is based on information provided to FHWA-FL from the various corridor studies, public input meetings, discussions with agencies and district staff, the ETDM screening review and summary report, and the procedures specified in FDOT's PD&E Manual. The information received to date does not indicate a likelihood for significant impacts from Alternative 3. If FHWA-FL receives additional information in the future to indicate a likelihood for a significant impact from this project, the Class of Action may be revised at that time.

Appendices

Degree of Effect Legend

Color Code	Meaning	ETAT	Public Involvement
0	None	The issue is present, but the project will have no impact on the issue; project has no adverse effect on ETAT resources; permit issuance or consultation involves routine interaction with the agency. The <i>None</i> degree of effect is new as of 12/5/2005.	No community opposition to the planned project. No adverse effect on the community.
1	Enhanced	Project has positive effect on the ETAT resource or can reverse a previous adverse effect leading to environmental improvement.	Affected community supports the proposed project. Project has positive effect.
2	Minimal to None -or- Minimal	Project has little adverse effect on ETAT resources. Permit issuance or consultation involves routine interaction with the agency. Low cost options are available to address concerns. The <i>Minimal</i> degree of effect is new as of 12/5/2005. Prior to 12/5/2005, a green degree of effect indicated <i>Minimal to None</i> .	Minimum community opposition to the planned project. Minimum adverse effect on the community.
3	Moderate	Agency resources are affected by the proposed project, but avoidance and minimization options are available and can be addressed during development with a moderated amount of agency involvement and moderate cost impact.	Project has adverse effect on elements of the affected community. Public Involvement is needed to seek alternatives more acceptable to the community. Moderate community interaction will be required during project development.
4	Substantial	The project has substantial adverse effects but ETAT understands the project need and will be able to seek avoidance and minimization or mitigation options during project development. Substantial interaction will be required during project development and permitting.	Project has substantial adverse effects on the community and faces substantial community opposition. Intensive community interaction with focused Public Involvement will be required during project development to address community concerns.
5	Potential Dispute -or- Dispute Resolution	Project does not conform to agency statutory requirements and will not be permitted. Dispute resolution is required before the project proceeds to programming. The <i>Potential Dispute</i> degree of effect pertains to the Planning Phase, while <i>Dispute Resolution</i> degree of effect refers to the Programming Phase.	Community strongly opposes the project. Project is not in conformity with local comprehensive plan and has severe negative impact on the affected community.
	No ETAT Consensus	ETAT members from different agencies assigned a different degree of effect to this project, and the ETDM coordinator has not assigned a summary degree of effect.	
	No ETAT Reviews	No ETAT members have reviewed the corresponding issue for this project, and the ETDM coordinator has not assigned a summary degree of effect.	

GIS Analyses

Since there are so many GIS Analyses available for Project #8127 - State Road 7 Extension, they have not been included in this ETDM Summary Report. GIS Analyses, however, are always available for this project on the Public ETDM Website. Please click on the link below (or copy this link into your Web Browser) in order to view detailed GIS tabular information for this project:

<http://etdmpub.fla-etat.org/est/index.jsp?tplID=8127&startPageName=GIS%20Analysis%20Results>

Special Note: Please be sure that when the GIS Analysis Results page loads, the **Programming Screen Summary**

Report Re-published 04/30/2007 Milestone is selected. GIS Analyses snapshots have been taken for Project #8127 at various points throughout the project's life-cycle, so it is important that you view the correct snapshot.
